European Vacancy Monitor

Issue 1 • November 2010

The European Vacancy Monitor is published quarterly by DG Employment, Social Affairs & Equal Opportunities of the European Commission.

This is a new publication within the Europe 2020 flagship initiative "An Agenda for New Skills and Jobs". It will be further refined also taking into account stakeholders' feedback. Neither the European Commission nor any person acting on behalf of the Commission may be held responsible for the use that may be made of the information contained in this publication. Comments are gratefully received and should be sent to:

HIGHLIGHTS

New information source: European Vacancy Monitor

The European Vacancy Monitor (EVM) presents an up-to-date picture of developments of the labour demand and the vacancy market in Europe. Data on job vacancies, job finders and hiring will provide insight into current growth occupations and areas of recruitment difficulties.

[>> Read more on page 2](#)

Even during the crisis 40 million people found new jobs - the number of job finders increases in 2010

Despite decreasing employment the labour market still showed substantial dynamics: At the same time 40 million people found a new job. The first half of 2010 showed a marked turn-around, especially in temporary agency work. The overall number of job finders increased by four percent compared to the first half of 2009. The second quarter of 2010 even showed an increase of eight percent compared to the same period in the previous year.

Highest demand by employers in Europe for sales, cleaning and restaurant jobs

Of the top 25 of 400 occupations in Europe, the groups in highest demand are shop, stall and market salespersons and demonstrators. They are followed (by some distance) by domestic helpers, cleaners and launderers, and housekeeping and restaurant-service workers.

[>> List of TOP 5 jobs on the EURES Portal: page 18](#)

[>> List of TOP 25 growth occupations per country: page 18](#)

Bottlenecks remain in the area of technical and administrative skills

Despite a generally capacious labour market in 2010, employers in most countries find vacancies requiring technical and administrative skills hardest to fill while vacancies requiring representative, managerial and elementary skills are easier to fill.

[>> Read more on page 11](#)

Skills requirements differ strongly per country

The highest shares of the higher educated among job finders are found in Ireland, Luxembourg, Belgium, Cyprus, UK and the Netherlands. The percentage of job finders with a lower education is high in Portugal, Malta, Spain and Italy.

I. INTRODUCTION

In response to shifts and developments in labour markets, the European Commission launched the “New Skills for New Jobs Initiative” aiming to support Member States to track, analyse and predict the skills needed in tomorrow’s labour markets. As part of the initiative, the European Commission has funded a monitoring system functioning at the same time as an “early warning tool” under the project “Monitoring Labour Market Developments in Europe”.

The results of the project will be published on a quarterly basis through two different publications: the European Job Mobility Bulletin (EJMB) and the European Vacancy Monitor (EVM).

The European Job Mobility Bulletin (EJMB) specifically targets mobile job seekers and EURES advisers. The bulletin presents the results of an analysis of data from the EURES Job Mobility portal as well as the corresponding database.

The European Vacancy Monitor (EVM) is more comprehensive and targeted at a broader audience, aiming to contribute to policy development and the functioning of labour markets. It provides an up-to-date, dynamic picture of developments in the demand for labour, using a wide range of sources to produce the relevant data. Data on job vacancies, job finders and hiring will also provide insight into areas with recruitment difficulties and skills shortages. This is the first issue to highlight the current status and results of the European Vacancy Monitor.

Key sources of information for the EVM are the Public Employment Services (PES), National Statistical organisations (NSOs), Temporary Work Agencies (TWAs), online recruitment services (ORS) and research institutions. Some information is collected by international bodies including Eurostat, the Statistical Office of the European Communities, and Eurociett, the European Confederation of Private Employment Agencies.

The monitor contains data for all EU-27 countries.

Information system “under construction”

Data collection for the EVM started in the second quarter of 2010 and is ongoing. Contacts with a network of relevant institutions have been established and will be extended continually. Future work will be based upon a systematic European-wide inventory of labour market information systems for all EU-27 countries. Given the diversity of national labour market information systems the results will also depend on the quality of data available at national level.

This first issue of the EVM presents the results based on readily available sources. More analysis of trends, vacancies as such and more detailed information at national level will follow in later issues when the network and framework for data collection are fully operational.

Many of the data used in this first bulletin come from Eurostat (<http://epp.eurostat.ec.europa.eu/portal/page/portal/statistics/themes>). A key source is the Labour Force Survey (LFS) which provides standardised, representative and very detailed information for all EU-27 countries. Data on job finders have been used as a proxy for filled job vacancies. They have been analysed in a new and specific way to maximise the information they yield on the current situation and trends with regard to demand for labour in Europe.

A second important source used is the Job Vacancy Statistics (JVS). The number of job vacancies is available through the JVS for 15 EU countries. Figures for EU-27 as a whole and for an additional six countries have been estimated (Estonia, France, Italy, Austria, Poland and Portugal).

The third source used for the EVM is the private sector, more specifically, through the combination of data from Eurociett and some larger

European Vacancy Monitor

Issue no. 1/2010 | November 2010

TWAs. Eurociett collects annual key data of employers' organisations in the agency industry in 24 EU countries as well as Switzerland. Eurociett requests its members to provide information on temporary agency work broken down according to experience and education, using its own classification system. This information is up-to-date for several countries until 2009 including a number of temporary work agencies.

Randstad, one of the largest temporary work agencies, provides information on a monthly basis on registered job vacancies in countries with a relatively high market share. The data only concern positions that cannot be filled directly from their existing pool of candidates. Their figures are based on daily measurements of the number of open job vacancies available online. It should be noted that job vacancies can be published by more than one Randstad subsidiary. Nevertheless, the overview still serves as an early indicator for developments in the

economy and the labour market.

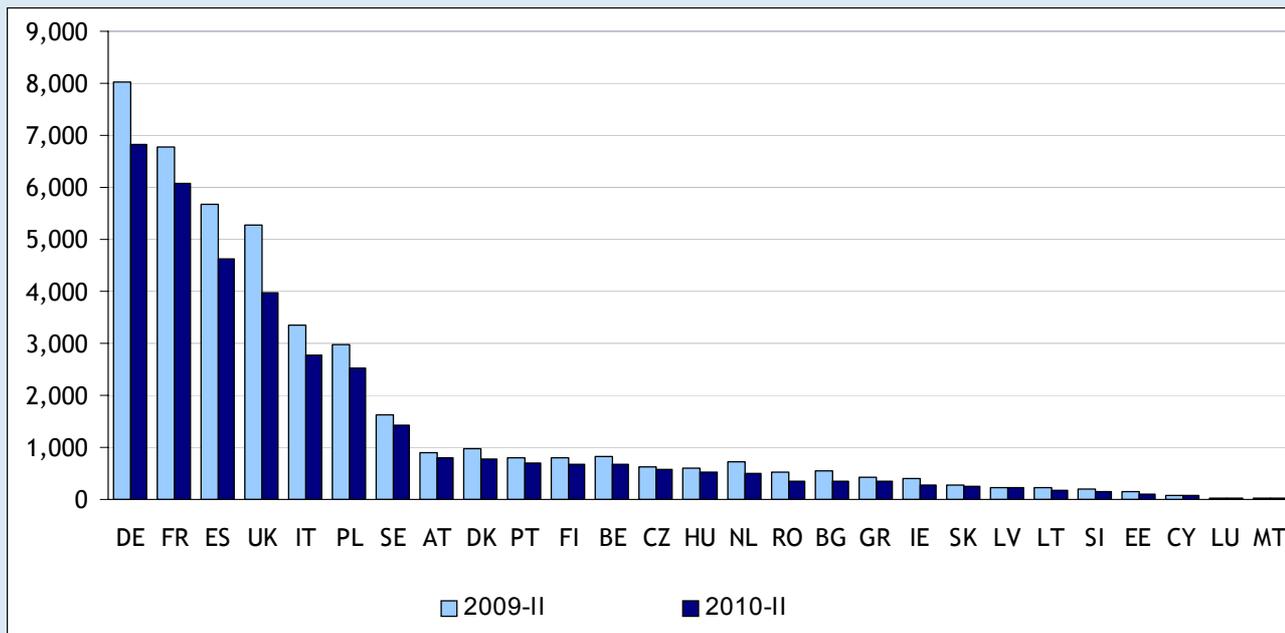

Manpower's annual Talent Shortage Survey comprises the views of 35,000 employers on their own job vacancy filling issues in 36 countries worldwide, including 17 EU countries.

The Monster Employment Index Europe provides monthly insight into on-line recruitment trends across the European Union. The Index is based on 1,400 corporate career sites and job boards, providing an indication of the (on-line) demand for specific occupations. The data presented apply to the EU-27 with the exception of Malta.

Detailed information of Public Employment Services (PES) will become available in future publications of the EVM.

Other sections that will be substantially expanded in upcoming editions are those related to skills. The present issue predominantly draws on sources that focus on education and qualifications.

II. CURRENT TRENDS JOB VACANCIES

40 million job finders last year

Despite the decrease in employment within the EU, labour markets kept some dynamism and many people found a new job. Employment dropped from 214 million jobs in the first quarter of 2009 to 211 million in the first quarter of 2010 (seasonally adjusted). At the same time, however, the Labour Force Survey shows that 40 million people found a new job between July 2009 and June 2010. The demand for personnel to replace people leaving continues, even at companies that are performing poorly and also in the public sector despite the decrease in public spending. In the private sector, some companies have even increased staff.

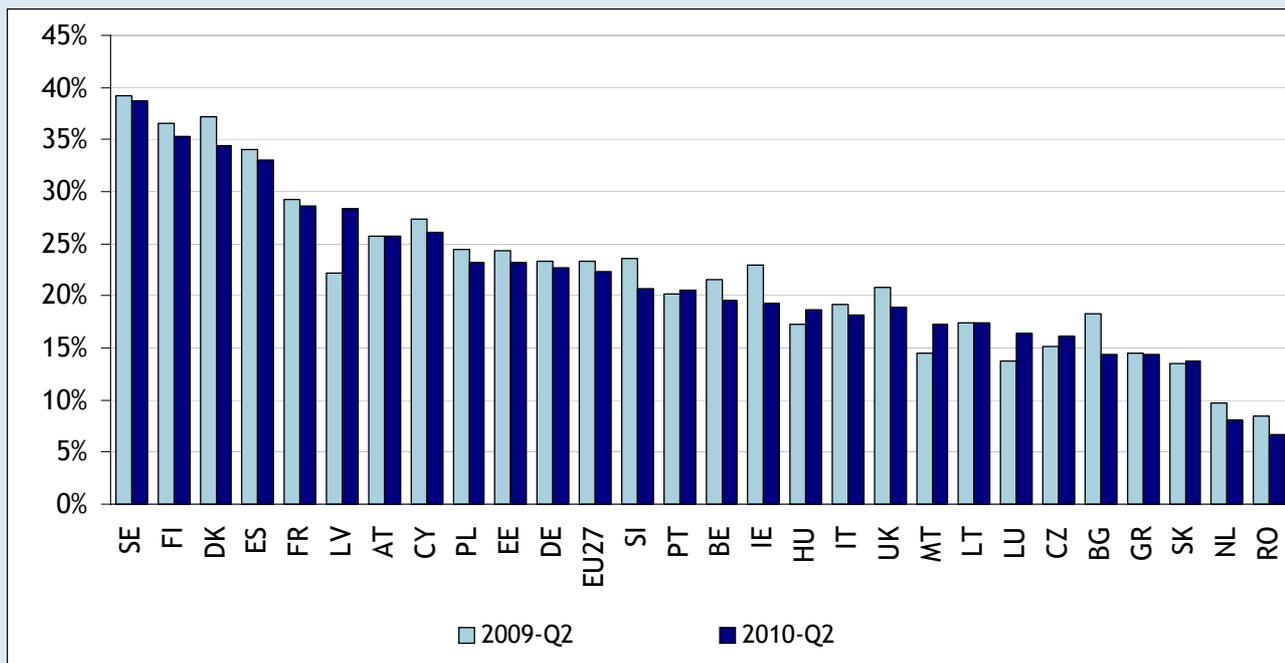

Countries with the largest numbers of job finders are Germany, France, Spain, the United Kingdom, Italy, Poland and Sweden. Together these seven countries account for 78 percent of all job finders in Europe (Chart 1).

Overall trend still downward, but first signs of increasing labour demand

Comparing the period July 2009 to June 2010 with July 2008 to June 2009, fewer people are finding work in most countries. The largest decreases occurred in Bulgaria, Ireland and Romania. Defying the general trend and showing increased labour demand are Luxembourg, Malta, Latvia, Hungary and the Czech Republic.

Overall job losses in the European Union did not stop until the second quarter of this year (Eurostat Newsrelease Euroindicators 134/2010, 15 September 2010). However, it is noteworthy that the number of job finders has been improv-

Chart 2: Number of job finders in the preceding year as percentage of the number of employees, 2009-Q2 and 2010-Q2

Source: ECORYS calculations based on Eurostat LFS data.

ing and in fact increasing in 2010. In the first half year of 2010, the number of job finders increased by four percent compared to the same period the year before. The second quarter of 2010 showed an eight percent increase compared to the same quarter in 2009.

Job vacancy figures also support this trend. Registered online vacancies from Monsterboard, for instance, increased by 15 percent between August 2009 and August 2010.

Labour markets still less dynamic

The overall dynamism of European labour markets remains in decline, as shown in declining figures for job vacancy mobility (Chart 2). Job vacancy mobility is the ratio between the number of filled job vacancies and employment (number of employees). This indicator reflects the dynamics at the demand side of the labour market. The ratio between the number of job finders and total employment was calculated as a proxy.

The decline is, however, slower than in the previous year. While job vacancy mobility decreased between 2009 and 2010, the decrease was only by one percent; to 22 percent. In contrast, the decline between 2008 and 2009 was four percent.

Differences are seen in the individual countries. Bulgaria and Ireland, for example, show a relatively high decrease in job vacancy mobility. Latvia, Malta, Luxembourg, Portugal, Hungary, Slovakia and the Czech Republic, however, noted a higher job vacancy mobility than the year before.

Change of mobility unrelated to geographical location or the size of the labour market.

The change of mobility seems unrelated to geographical location or the size of the labour market. There are differences between countries in labour market dynamics but they remained more or less the same.

Table 1: Total daily average number of agency workers per country (in FTE x 1,000), 1998, 2008 and 2009

Source: Eurociett (September 2010), NS: not significant, Na: not available, *estimated

Note: The daily average number of temporary agency workers is significantly lower than the total number of temporary agency workers during the year.

Within the old Member States, for example, the vacancy rate, or the proportion of total posts that are vacant, is higher in the north and west than in the south (see Annex, table A1)).

European Vacancy Monitor

Issue no. 1/2010 | November 2010

Opening up of new markets for temporary agency work during the last decade

According to Eurociett the number of temporary agency workers in Europe increased from 1.9 million in 1998 to 3.9 million in 2008 in full-time equivalents (fte). In the last ten years the number of temporary agency workers in Europe doubled, which is partially a result of the progres-

sive liberalisation of tightly regulated labour markets, notably in Italy, Germany, and the Nordic countries, and the opening of new markets in Central and Eastern Europe. In 2009 the volume of temporary agency work decreased somewhat to 3.5 million fte (Table 1).

Wider recovery visible in temporary agency work

Temporary agency work is an important indicator for the developments in the economy and on the labour market. If a company does not perform well, the employers will first cut personnel not on the payroll. Once the perspective becomes more favourable, employers will not hire permanent staff, but rather start by hiring temporary agency workers involving less economic risk for the company.

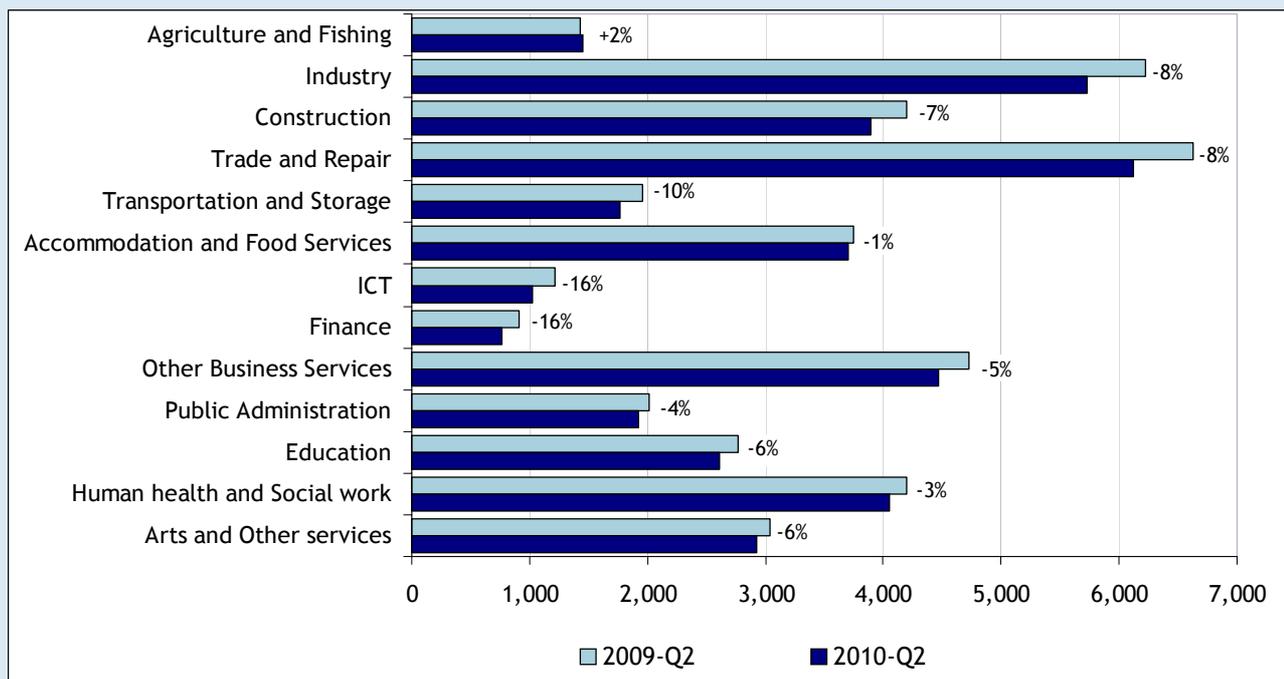

Figures of job vacancies of Randstad suggest a (very) rapid recovery of the demand for tempo-

rary agency workers in the first half of 2010, especially in Germany and Spain. The demand for temporary agency workers in the UK is recovering at a slower pace. Table 2 shows how many job vacancies are open per day (daily averages on a monthly basis) in six EU countries.

III. CURRENT TRENDS IN DEMAND FOR OCCUPATIONS

To sum up the most important findings, the declining demand for labour is unevenly spread over sectors and occupations. Hardest hit are the ICT and finance sectors as well as the occupational groups of clerks and professionals.

At the same time, however, demand for a number of occupations is growing. Among the top 25 fields for job finders, demand has been growing for manufacturing labourers and, though to a lesser extent, demand has also been growing for social-work associated professionals as well as

agricultural, fishery and related labourers. In absolute numbers demand has increased the most for manufacturing labourers, too. Data from the LFS are supported by sources on online employment.

Demand discrepancies occur in particular in Spain, Sweden, the UK and the Netherlands. They seem to be decreasing, according to several indicators.

Highest decline in labour demand in ICT and finance sectors

For most sectors the number of job finders decreased. Differences between sectors are nevertheless notable. They range from a 16 percent decline in both ICT and finance, to a bare two percent growth rate in agriculture and fishing. In absolute terms the largest decline in the demand for labour is in the larger sectors of trade and repair and industry (Chart 3).

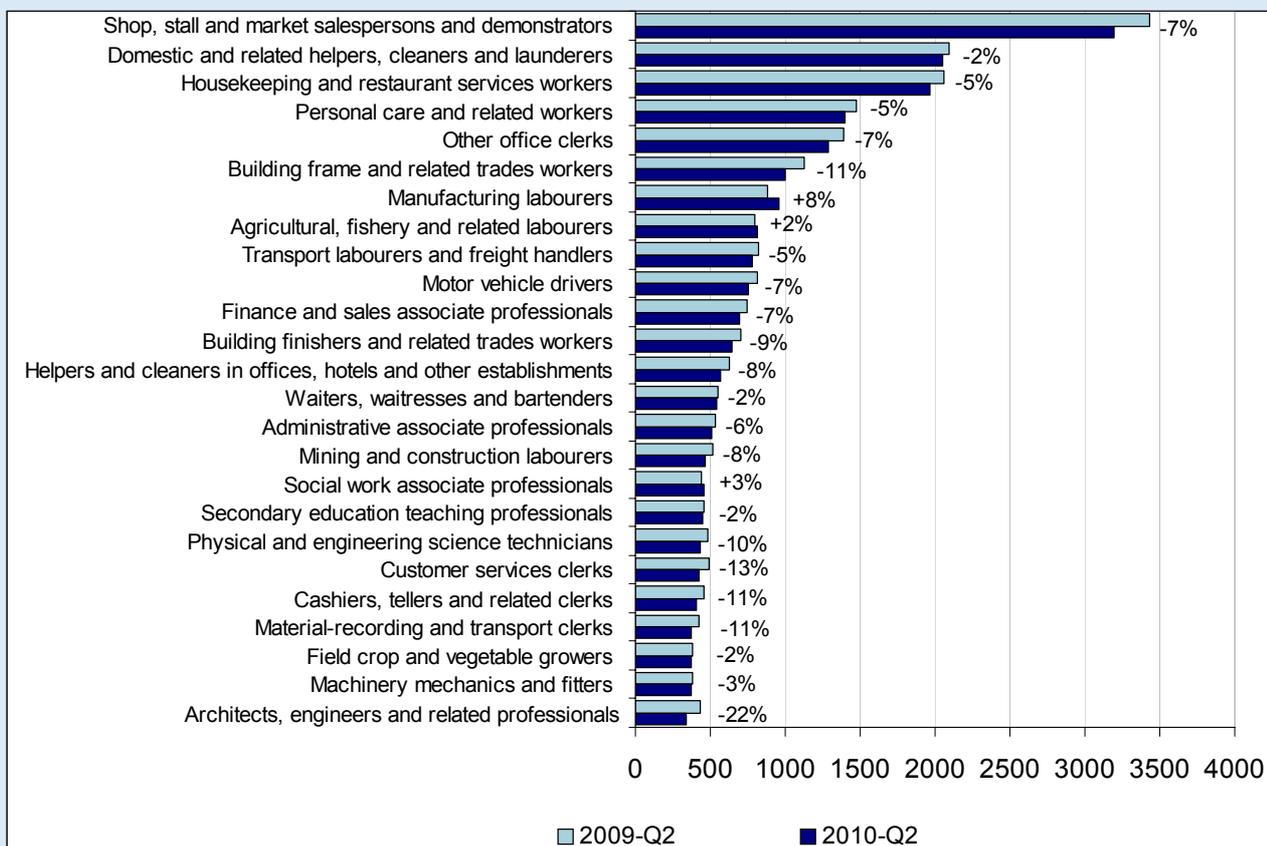

Occupational structure of labour demand differs between countries

The demand for certain occupations varies greatly between countries. This can be seen in eight countries for which Eurostat collects data (Annex, Chart A1). The share of managers, technicians and associate professionals required, for example, is relatively low in the Czech Republic and Slovenia while relatively high in Latvia and Bulgaria. The Czech Republic and Slovenia have relatively many job vacancies for plant and machine operators, assemblers and elementary occupations whereas Lithuania has relatively few job vacancies for clerks and sales.

The relative importance of occupational groups in EU-27 remains similar

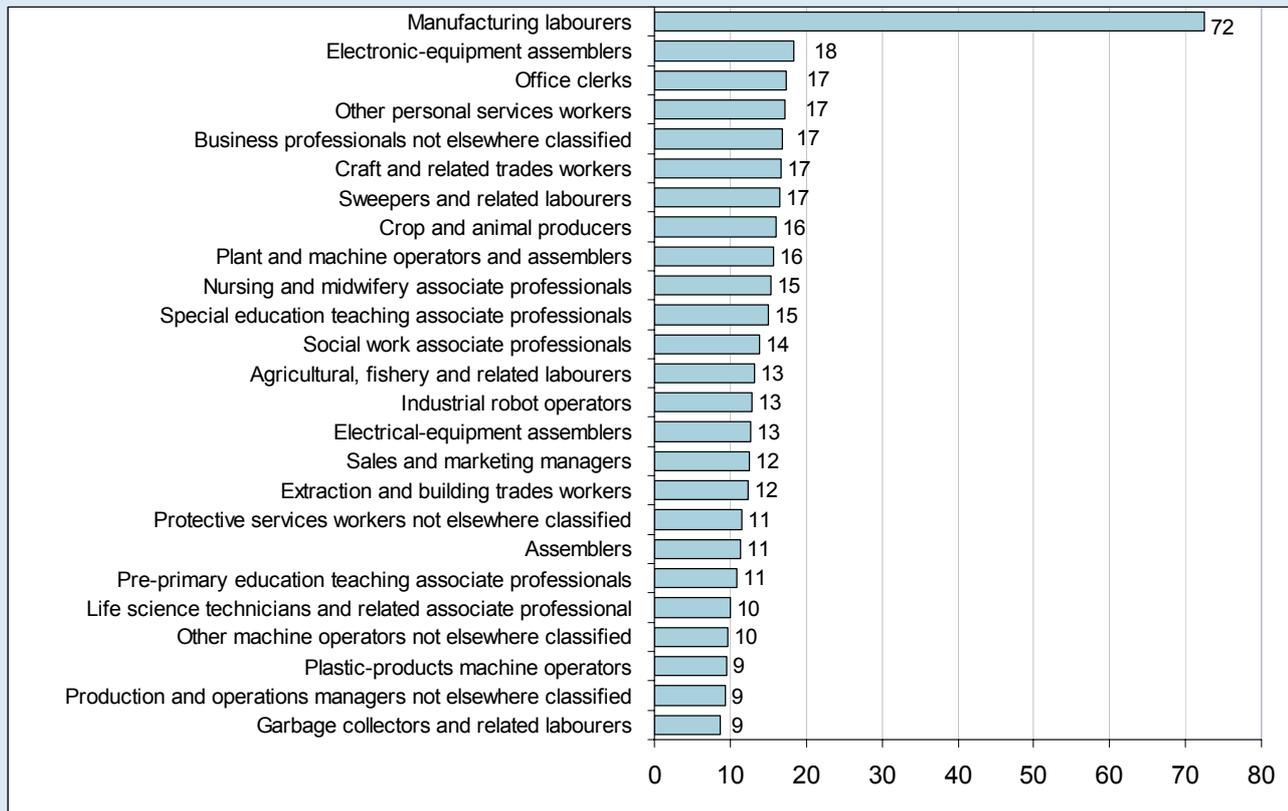

When analysing the occupational structure of job finders on an aggregated level for broader occupational groups (International Standard Classification of Occupations - ISCO 1 digit) we see that the order of importance of occupations in the demand remains the same. The group of service workers and shop and market sales workers are still the largest occupational group followed by elementary occupations (occupations with modest educational requirements) and craft and related trades workers (Table 3).

Chart 4: Top occupations of job finders in the preceding year (x 1,000), 2009-Q1 and 2010-Q2 (ISCO 4 digit)

Source: ECORYS calculations based on Eurostat LFS data.

Chart 5: Ranking of occupations with the highest growth in number of job finders (x 1,000), 2009-Q2 to 2010-Q2 (ISCO 4 digit)

Source: ECORYS calculations based on Eurostat LFS data.

The findings from Monsterboard which are based upon a monthly monitoring of online job opportunities across 24 European countries show a slightly different picture. This might be explained by the specifics of on-line recruitment which does not take place for all occupations to the same degree. Across occupational categories for the past 13 months (September 2009 - September 2010) demand has increased by 21 percent. While there are similarly indicated more job opportunities for service workers and shop and market sales workers (50%) as well as for elementary occupations (33%), on-line demand increased especially for plant and machine operators and assemblers (51%), but also for craft and related trade workers (35%).

Highest demand for sales, cleaning and restaurant occupations, highest growth for manufacturing labourers

Data on European job finders in 400 occupation groups (ISCO 4 digit) has been studied in detail. The EU Top 25 of the most frequently demanded occupations is listed in Chart 4.

The occupation highest in demand across the EU, in absolute numbers, is shop, stall and market salespersons and demonstrators (more than 3 million job finders a year). They were the largest group hired from July 2009 to June 2010. They are followed (by some distance) by domestic and related helpers, cleaners and launderers (more than two million), and housekeeping and restaurant service workers (two million).

European Vacancy Monitor

Issue no. 1/2010 | November 2010

With regard to the highest growth in the number of job finders (Chart 5), manufacturing labourers are at the top of this Top 25 list with 72,000 filled vacancies from July 2009 up to and including June 2010. Most of the occupations in this list are less common occupations, such as electronic equipment assemblers (18,000) and extraction and building trade workers (12,000).

Diverse country patterns for Top 25 growth occupations

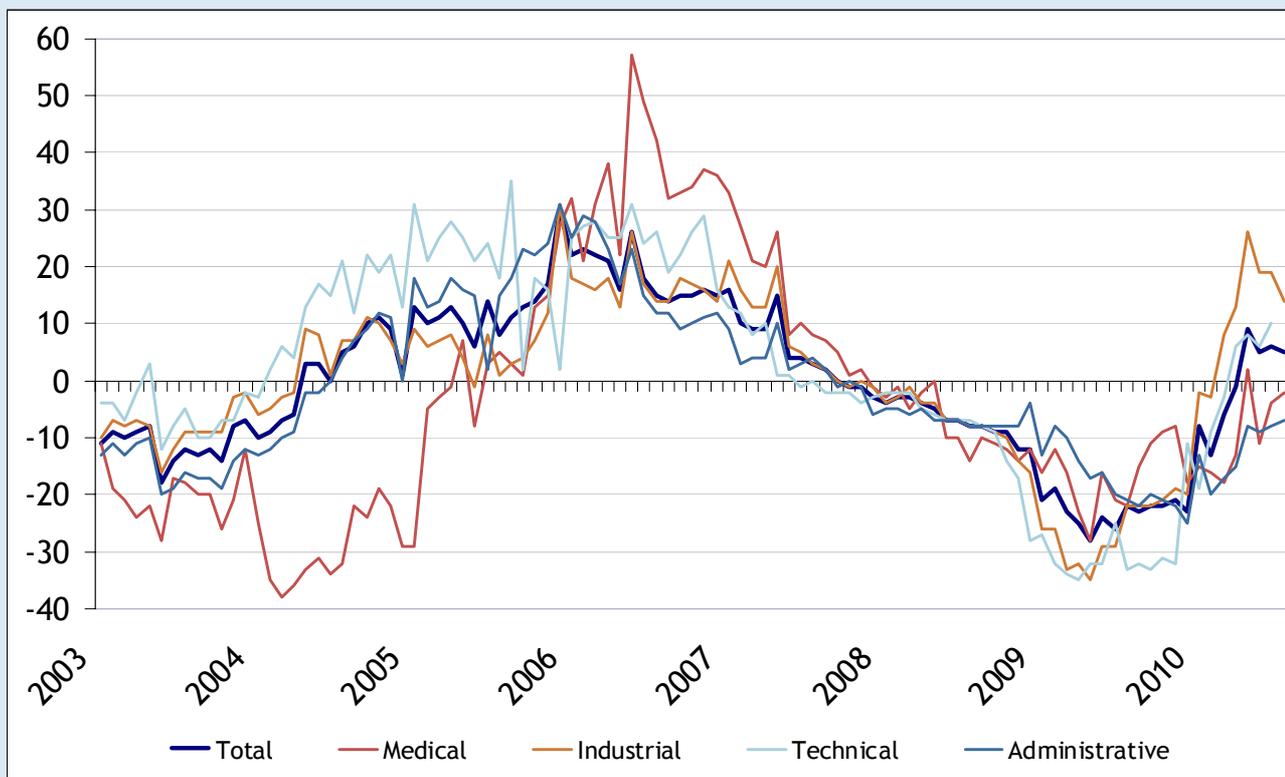

An analysis of the Top 25 fastest growing occupations per country (ISCO 4-digit) reveals specific patterns for the individual countries. For example none of the occupations in the EU Top 25 is found in more than seven countries' individual Top 25. This is, however, not surprising,

considering that the ranking is based on no less than 400 occupations. It does show that the occupation structure of the demand for labour depends on the situation in a specific country. A detailed list of the TOP 25 per country is included under point VI).

Country study Netherlands: May 2010 as turning point

ABU, the employers' organization for temporary work agencies in the Netherlands measures the temporary work volume in Euros (turnover) and paid hours per month. May 2010 was the first month in which after a period of decline temporary agency work started to grow again. Due to the weight allotted to this indicator many people in the Netherlands view May 2010 as a turn-

Chart 6: Growth rate of temporary work (in hours) per month compared to the same period one year earlier, January 2003 - September 2010 in the Netherlands

Source: ABU (Algemene Bond Uitzendondernemingen), the TWA employers' organisation in the Netherlands.

ing point in the development towards a better performing economy and labour market (Chart 6).

Increasing volume of industrial occupations in temporary agency work

A more detailed sectoral analysis of temporary agency work performed in the Netherlands confirms the global analysis of the European Vacancy Monitor, while the development is more favourable in some sectors than in others. Industrial occupations in temporary agency work were the first to show clear signs of recovery. After a long period of decreasing, industrial employment showed growth for two periods in a row. Hours increased 13 percent and turnover increased 14 percent compared with the same period last year. For technical occupations a similar development can be observed although to a less extent. However, for medical occupations and administrative occupations the decline has slowed down without reaching yet a more stable positive growth.

IV. BOTTLENECKS

The decisive measure for mismatches between labour market supply and demand is the share of job vacancies that are difficult to fill. For this issue of the European Vacancy Monitor the share of employers having difficulties filling job vacancies is used as indicator. The results are based upon the Manpower's Talent Shortage Survey, which comprises the views of 35,000 employers in 36 countries worldwide.

Two statistical indicators complement the picture: the ratio of stock to inflow of job vacancies and the ratio of the stock of job vacancies to unemployment. The statistics are derived from Eurostat (JVS and LFS). These ratios are calculated for the private sector, excluding agriculture, public services and other services. The figures for France and Italy are estimated by combining vacancy ratios from Eurostat with

national statistics on employment by economic sector and company size.

A fourth indicator is the ratio between the job vacancies registered by the Public Employment Services (PES) and unemployed. This indicator will be included in the subsequent issues of the European Vacancy Monitor when the data becomes available.

Overall decrease in recruitment difficulties

It does not come as a surprise that overall, European employers have had less difficulty finding workers matching their vacancies in 2010 than in previous years. This change is explained by the context of the crisis, as more jobseekers competed for a decreasing number of job vacancies (see Table 4). The share of employers experiencing difficulty in filling job vacancies decreased from 40 percent in 2006 to 31 percent in 2010. However, even in times of crisis in some areas vacancies are more difficult to fill.

More recruitment difficulties in Poland, Romania, Switzerland and Austria

Countries in which a relatively large share of the employers finds it difficult to fill job vacancies are Poland, Romania, Switzerland and Austria (Table 4). On the other hand, employers in Ireland, UK, Norway, Spain and also in the Netherlands are relatively positive about their chances of finding the right employees for their vacancies. For some of these countries this can be explained by the labour market situation, above all in Ireland and Spain, where the number of vacancies has sharply decreased, while unemployment has increased. As a result, the fewer vacancies that remain have become easy to fill. However, this is not the case for all.

Discrepancies between demand and supply concentrated in the centre of Europe

According to the two indicators based on Eurostat figures, the largest discrepancies between demand and supply are located in eight coun-

tries, mostly located in the middle of Europe: Austria, the Netherlands, Germany, UK, Luxembourg, the Czech Republic, Greece and Cyprus (Annex Table A2).

In these countries, in the first quarter of 2010 there were relatively few unemployed people compared to the number of open job vacancies. As result employers found it more difficult to fill their vacancies.

On the other hand, relatively few open job vacancies existed in Latvia, Lithuania, Slovakia, Portugal, Estonia and Romania, resulting in lower demand discrepancies and easier to fill vacancies.

Table 4: Share of employers having difficulties filling job vacancies, 2006-2010

| | 2006 | 2007 | 2008 | 2009 | 2010 |
|--------------|------|------|------|------|------|
| Poland | | | 49 | 48 | 51 |
| Romania | | | 73 | 62 | 36 |
| Switzerland | 48 | 37 | 36 | 36 | 35 |

| Total Europe | 39 | 31 | 32 | 25 | 23 |

Source: Manpower (2010)

Jobs on average take 20 days to be filled

The ratio of the stock of vacancies to the inflow of vacancies is also highest in countries located in the centre of Europe.

After multiplying this ratio by the 365 days in a year, this ratio indicates the average duration of

open vacancies in a static “equilibrium” situation. Job vacancy duration is relatively long in the Netherlands, Germany, Cyprus, the Czech Republic and the UK.

Objective indicators do not always correspond to employers’ perceptions

While the statistical indicators present more or less similar outcomes, the subjective perceptions of employers demonstrate a different ranking of countries where vacancies are hard to fill (Annex table A2). One explanation can be that employers implicitly compare their situation with the past situation in their own country rather than the situation in other countries. The Netherlands and the UK have an especially long history of high stocks of vacancies and low unemployment. Even though vacancies in the Netherlands are currently hard to fill according to international statistics, both Dutch and UK employers still refer to the situation in the late nineties when labour market bottlenecks led to strong wage increases.

According to employers bottleneck area in skilled trades

According to Manpower’s survey among employers at the top of the list of difficult to fill job vacancies in most countries are skilled trades and sales representatives (Table 5). A second group of occupations are technicians and engineers. Although the ICT sector was identified as one of the hardest hit, a mismatch persists, as at the same time appropriate ICT staff has not been easy to find. Another group indicated as hard to find by employers are personal assistants, administrative assistants and office support staff, secretaries and accounting and finance staff. The recruitment of chefs and cooks, restaurant and hotel staff also bears some difficulties. The same holds true for drivers.

The findings indicate a high demand for technical, administrative and personal skills. Various categories of managers, teachers, researchers,

representative staff and low-skilled trades are less frequently indicated as hard to fill in Europe.

Table 5: Top 10 difficult to fill job vacancies according to employers (descending order) per country, 2010

| | |
|-----------------------|---|
| Austria | Skilled trades, sales representatives, technicians, drivers, IT staff, doctors and other non-nursing health professionals, cleaners and domestic staff, chefs and cooks, mechanics, sales managers |
| Czech Republic | Skilled trades, sales representatives, chefs and cooks, doctors and other non-nursing health professionals, drivers, IT staff, customer service representatives and customer support staff, receptionists, secretaries, personal assistants, administrative assistants and office support staff, management, executives |
| Germany | Skilled trades, doctors and other non-nursing health professionals, IT staff, engineers, drivers, sales representatives, nurses, technicians, management and finance staff |
| Belgium | Skilled trades, accounting and finance staff, secretaries, personal assistants, administrative assistants, and office support staff, technicians, sales representatives, drivers, production operators, labourers, chefs and cooks, mechanics |

V. EDUCATION AND SKILLS NEEDED

The data used for this first issue of the European Vacancy Monitor have been analysed to present an overview of education and qualification requirements.

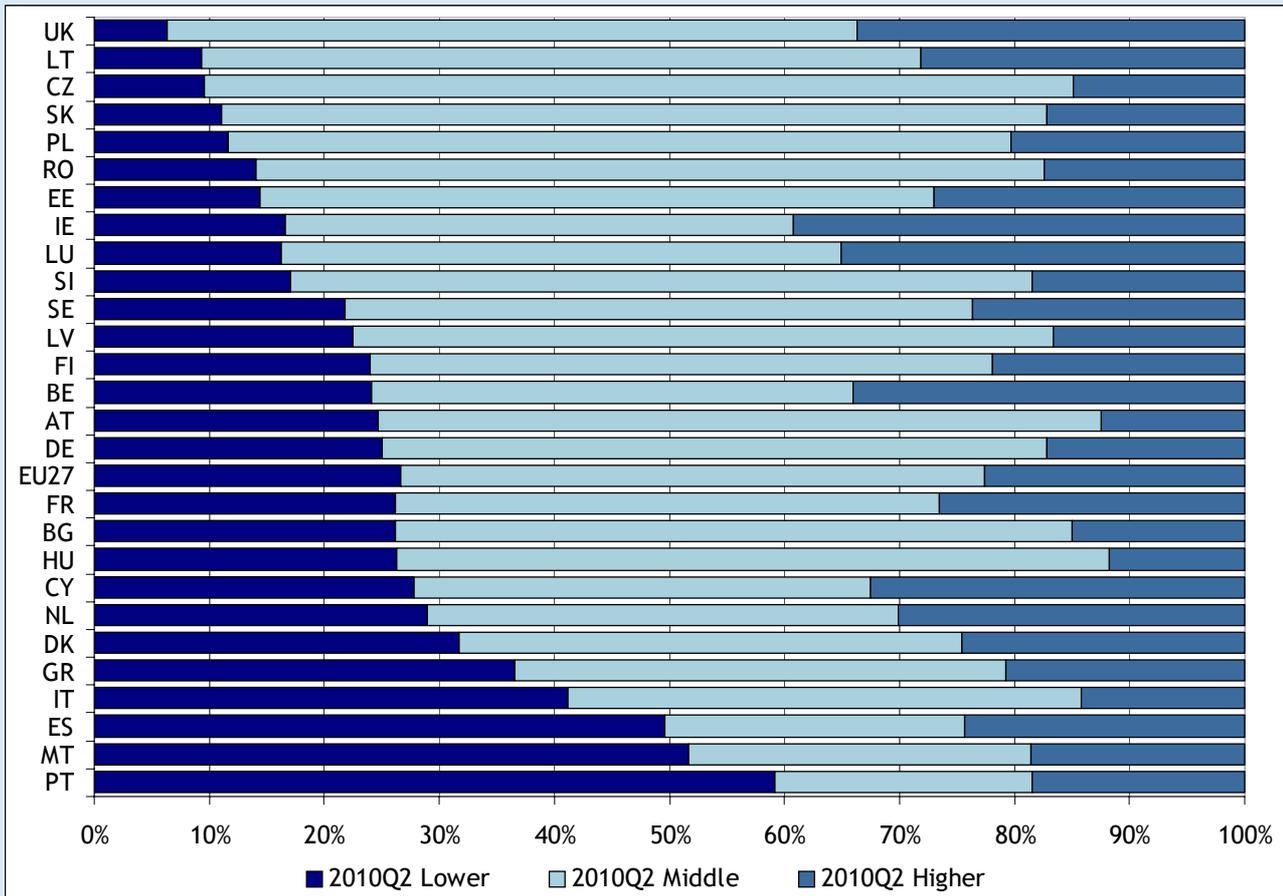

More job opportunities in Europe for those with upper or post-secondary education

The LFS provides a good picture of the job vacancy requirements vis-à-vis educational levels. Of all the job finders in the period July 2009 to June 2010, nearly one quarter (24%) received an education at primary or lower secondary level (International Standard Classification of Education ISCED level 1 and 2). Half of all job finders (54%) have an education at upper secondary or post-secondary level (ISCED 3, 4 and 5), whereas 22 percent received a tertiary education (ISCED 6 first stage and 7 second stage) (Chart 7).

Education level of job finders relatively high in Ireland, Luxembourg, Cyprus, Belgium, UK and the Netherlands

The highest share of the higher educated among job finders is found in Ireland (37%), Luxem-

Chart 7: Educational level of job finders in the preceding year per country, 2010-Q2

Source: ECORYS calculations based on Eurostat LFS data.

bourg (34%), Cyprus (34%), Belgium (33%), UK (33%) and the Netherlands (30%). The lowest share is found in Austria (12%), Hungary (12%), Italy (13%), Bulgaria (14%), Czech Republic (15%) and Slovakia (15%).

More labour demand for less qualified in Southern Europe

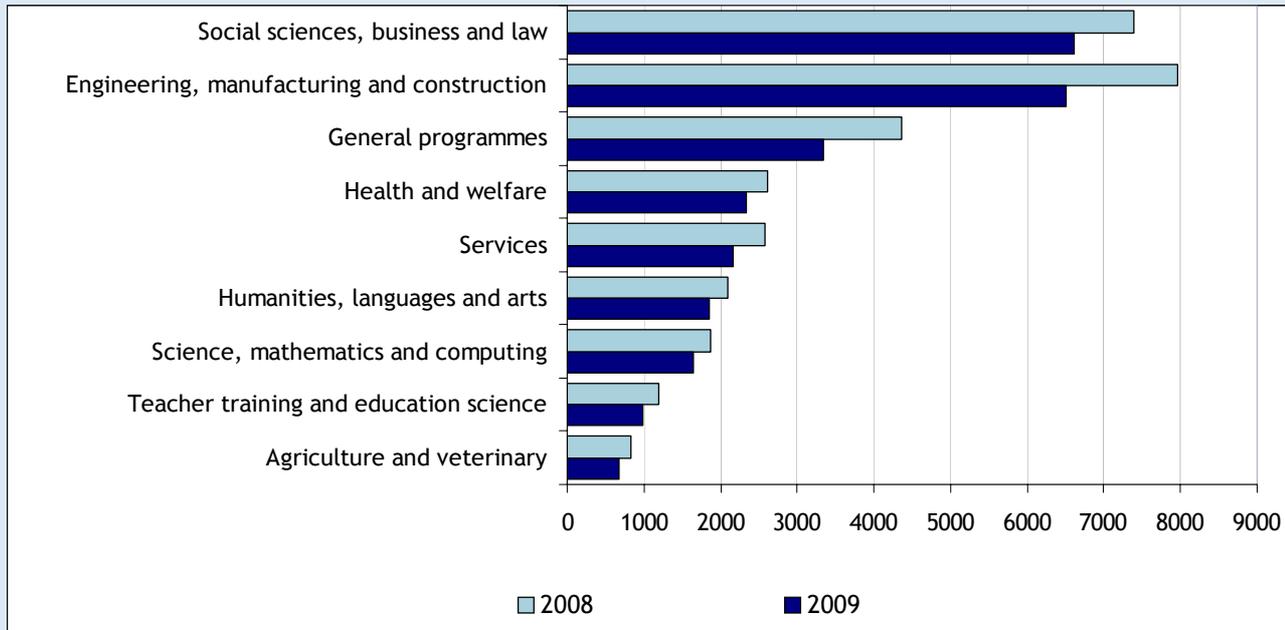

The highest share of job finders with a lower education is seen in Portugal (59%), Malta (52%), Spain (50%), Italy (43 %) and Greece (37 %). This finding might be related to the combination of the economic structures and educational level. Agriculture and tourism are, for example, important in these countries and these are sectors

with a relatively high demand for lower skilled employees.

Educational background of job finders mainly in engineering, manufacturing and construction, social sciences, business and law

The LFS also provides insight into the specific education field of job finders, who despite a strong decline during the crisis are mostly people with a background in engineering, manufacturing and construction or in social sciences, business and law (figures only per calendar year). There are relatively few job finders trained in agriculture and veterinary (Chart 8).

Chart 8: Educational field of job finders in 2008 and 2009 (x 1,000)

Source: ECORYS calculations based on Eurostat LFS data.

Temporary agency work: Education levels relatively high in Sweden, Norway and Bulgaria

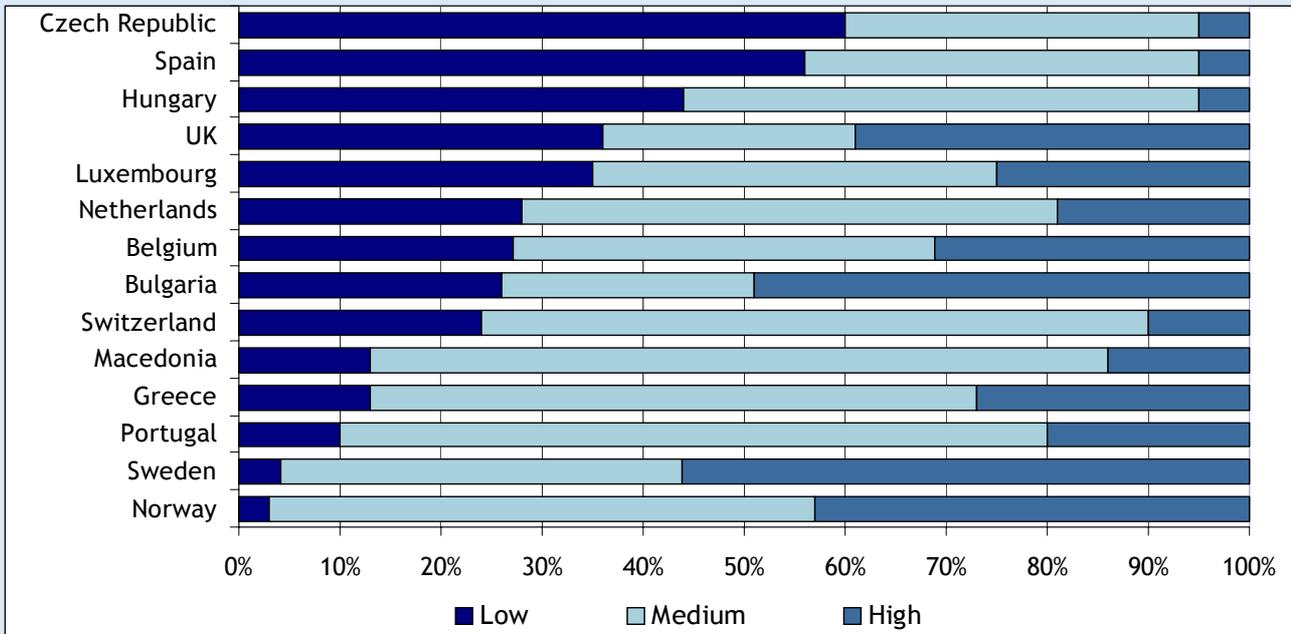

The European Vacancy Monitor includes information about the educational level of the temporary agency workers for 14 countries. This concerns the educational level of the temporary agency workers, not the education required for the temporary work (Chart 9). The differences between countries are notable, presumably, because the structure of temporary work varies from country to country.

While the Czech Republic, Spain and Hungary have relatively many lower educated temporary agency workers, Norway, Sweden, Portugal and Greece have relatively few workers in this category.

In some countries temporary agency workers have predominantly a medium education level like in Norway, Portugal, Greece, Switzerland and the Netherlands, whereas in Sweden, Bul-

garia, Norway and UK between 40 and more than 50 % have a higher level of education.

Chart 9: Educational level of temporary agency workers (2008)

DEFINITIONS AND CONCEPTS

Job vacancy (definition EC)

The official definition of a job vacancy is included in Article 2 of Regulation (EC) No 453/2008 and is used by EUROSTAT. A job vacancy shall mean a paid post that is newly created, unoccupied, or about to become vacant: a) for which the employer is taking active steps and is prepared to take further steps to find a suitable candidate from outside the enterprise concerned, and b) which the employer intends to fill either immediately or within a specific period of time. This is a stock figure.

Job finders

Job finders are people who:

a) Are employed in a reference week of that quarter and

b) Have started their job in a month at most three months earlier than the month of the reference week.

The number of job finders is calculated quarterly using the EU Labour Force Survey from Eurostat.

Job vacancy rate

The Job Vacancy Rate (JVR) is the proportion of total posts that are vacant: the number of job vacancies divided by the number of occupied posts plus the number of job vacancies. In that case employment only refers to the employees on the payroll, while excluding the self-employed. This is a stock figure. The JVR is often used to confront the unemployment rate,

showing the inverse relation between job vacancies and unemployment.

Job vacancy mobility

The job vacancy mobility (JVM) is the ratio between the number of filled job vacancies and employment (number of employees). We have used the number of job finders as a proxy for the number of filled job vacancies. The indicator reflects the dynamics at the demand side of the labour market.

Job vacancy duration

The job vacancy duration is the period a vacancy is open. As counterpart of the period of unemployment, the vacancy duration is important in the analysis of the labour market. The vacancy duration can be calculated on the basis of the ratio between the stock and the flows of vacancies, and vice versa.
