U.S. Bureau of Labor Statistics Keith Hall, Commissioner

The *Monthly Labor Review* is published monthly by the Bureau of Labor Statistics of the U.S. Department of Labor. The *Review* welcomes articles on employment and unemployment, compensation and working conditions, the labor force, labor-management relations, productivity and technology, occupational safety and health, demographic trends, and other economic developments.

The *Review's* audience includes economists, statisticians, labor relations practitioners (lawyers, arbitrators, etc.), sociologists, and other professionals concerned with labor related issues. Because the *Review* presents topics in labor economics in less forbidding formats than some social science journals, its audience also includes laypersons who are interested in the topics, but are not professionally trained economists, statisticians, and so forth.

In writing articles for the *Review*, authors should aim at the generalists in the audience on the assumption that the specialist will understand. Authors should use the simplest exposition of the subject consonant with accuracy and adherence to scientific methods of data collection, analysis, and drawings of conclusions. Papers should be factual and analytical, not polemical in tone. Potential articles, as well as communications on editorial matters, should be submitted to:

Executive Editor Monthly Labor Review U.S. Bureau of Labor Statistics Room 2850 Washington, DC 20212 Telephone: (202) 691–7911 Fax: (202) 691–5908 E-mail: **mlr@bls.gov**

The Secretary of Labor has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department.

The opinions, analysis, and conclusions put forth in articles written by non-BLS staff are solely the authors' and do not necessarily reflect those of the Bureau of Labor Statistics or the Department of Labor.

Unless stated otherwise, articles appearing in this publication are in the public domain and may be reproduced without express permission from the Editor-in-Chief. Please cite the specific issue of the *Monthly Labor Review* as the source.

The August Review

This issue of the Review kicks off with the 2011 installment from the Bureau's Job Openings and Labor Turnover Survey (JOLTS) program. BLS economists Katherine Bauer Klemmer and Robert Lazaneo examine JOLTS data to take a close look at how job openings, hires, and separations have fared since the 2007-2009 recessionary period through the end of 2010. Job openings, which can be considered an indicator of labor demand, increased modestly during the period after reaching a series low in July 2009. Hires, which can be thought of as a measure of worker flows, followed the same pattern and increased modestly through the end of 2010 after reaching a series low in October 2009. Separations, also thought of as a measure of worker flows, decreased slightly. The author's examination of these data provides insights into how employers react to changes in the business cycle and, arguably, affords additional evidence of the importance of data from the JOLTS program as business cycle indicators.

Another source of information on employer behaviors during business cycle changes is the Bureau's Business Employment Dynamics (BED) program. BED data measure gross job gains resulting from opening and expanding private sector business establishments and gross job losses resulting from closing and contracting establishments. The BED program tabulates the data by industry and by firm size (number of employees). In

their article, BLS economists Caryn N. Bruyere, Guy L. Podgornik, and James R. Spletzer examine the underlying dynamics of the employment losses sustained during the 2007–2009 recession. The authors also include a comparative analysis of BED and JOLTS data and conclude that BED data on gross job gains and gross job losses and JOLTS data on hires and separations exhibit similar business cycle properties. The paper concludes that the two data series complement each other and add to our understanding of employment dynamics during recessions.

Finally this month, in our Regional Reports department, Maggie C. Woodward reviews the rates of unemployment during the 2000-2010 period among the different labor market areas (LMAs) in the United States. The author finds that, prior to the 2007-2009 recession, metropolitan areas (areas with populations of at least 50,000) had unemployment rates that were 0.4 percentage point lower, on average, than micropolitan areas (areas with populations of at least 10,000 but less than 50,000) rates. However, during the recession, unemployment rates increased for all types of LMA and were about the same for all areas by 2010.

Summer youth employment

From April to July 2011, the number of employed youths 16 to 24 years old rose by 1.7 million, to 18.6 million, the U.S. Bureau of Labor Statistics reported in August. The share of young people employed in July was 48.8 percent, the lowest rate for any July on record for the series (dating back to 1948). Unemployment among youths increased by 745,000 between April and July, more than last year's increase of 571,000, but well below the levels seen in 2008 and 2009 (1.2 and 1.1 million, respectively). For a full discussion of the jobs situation for young people in the summer of 2011, see the entire news release at www.bls.gov/news. release/archives/youth_08242011. pdf. Additional information is available from the Current Population Survey at www.bls.gov/cps.

Real average hourly earnings

Real average hourly earnings for all employees fell 0.1 percent from June to July, seasonally adjusted, BLS reported this month. For the 12-month period from July 2010 to July 2011, real average hourly earnings fell 1.3 percent, seasonally adjusted. The full news release can be found online at www.bls.gov/news.release/ archives/realer_08182011.pdf. Additional information is available from the Current Employment Statistics program at www.bls.gov/ces. □

Job openings and hires show little postrecession improvement

JOLTS data show only modest labor market gains since the end of the 2007– 2009 recession; the job openings and hires levels have been rising since mid– 2009 but, at the end of 2010, were well below their prerecession levels

Katherine Bauer Klemmer and Robert Lazaneo

Katherine Bauer Klemmer and Robert Lazaneo are economists in the Division of Administrative Statistics and Labor Turnover in the Office of Employment and Unemployment Statistics at the Bureau of Labor Statistics. Email: klemmer. katherine@bls.gov or lazaneo.robert@bls.gov

ob Openings and Labor Turnover Survey (JOLTS) data showed only slight J improvement since June 2009, the end of the most recent recession.1 The seasonally-adjusted number of job openings-a measure of labor demand-increased from 2.4 million in June 2009 to 2.9 million in December 2010. While the level shows improvement, it is still well below the 4.4 million posted for December 2007, the onset of the recession. The hires level-a measure of worker flows-increased from 3.6 million at the end of the recession to 3.9 million in December 2010. The separations level, another worker-flow measure, decreased from 4.1 million in June 2009 to 3.8 million in December 2010. (See table 1.)

The JOLTS program measures job openings, hires, and separations on a monthly basis by industry² and geographic region. JOLTS gauges labor demand by collecting data monthly from a sample of approximately 16,000 nonfarm business establishments. Published JOLTS data are available from December 2000 forward. Unless otherwise noted, JOLTS data used in this report are seasonally adjusted.

Job openings

Job openings reflected a contraction in labor demand during the most recent recession. Total private job openings leveled off and then began to decline in advance of the Jan-

uary 2008 peak in the Current Establishment Statistics³ (CES) total private employment estimates and before the official start of the recession.⁴ The rate of decrease in job openings accelerated at the start of the recession. The decline in job openings then slowed in the spring of 2009. In July 2009, the total private job openings level dropped to a series low of 1.8 million, which was 2.5 million below the March 2007 peak of 4.3 million. Since July 2009, job openings have climbed steadily. Job openings and employment tend to move in a similar pattern. Fluctuations or irregularities in the JOLTS data are generally attributable to its relatively small sample size and resultant sampling error. (See chart 1 for a comparison of JOLTS job openings and CES employment.)

Census effect. Job openings attributable to the 2010 decennial census are reflected in the JOLTS total nonfarm job openings estimates, while JOLTS total private job openings exclude government job openings. In chart 2, the number of government job openings is measured on the right axis and the total nonfarm and total private job openings are measured on the left axis. Some census-related job openings became available in late 2008. Then, in the spring of 2009, job openings for the first major hiring of the 2010 census became available. In spring 2010, the need for door-to-door follow-up interviews with households that hadn't responded to

| Table 1. Job openings, hires, and separations, selected months, seasonally adjusted [In millions] [In millions] | | | | | | |
|---|--|------------------------------------|------------------------------------|------------------|--|--|
| Category | December 2007 (recession start) | June 2009 (recession end) | Trough (T) or series low (L) | December 2010 | | |
| Job openings | 4.4 | 2.4 | 2.1 (T= July 2009) | 2.9 | | |
| Hires | 5.0 | 3.6 | 3.6 (T= Oct 2009) | 3.9 | | |
| Separations | 4.9 | 4.1 | 3.5 (L= Jan 2010) | 3.8 | | |

the mailed census form or had not received one in the mail resulted in the posting of additional job openings for census workers.⁵

Job openings by region. Regional job openings showed trends similar to those for the nonfarm total. Job openings in each of the four regions trended downward before the beginning of the most recent recession. The West, South, and Northeast each experienced series troughs in July 2009, and the Midwest experienced its trough in April 2009. Job openings in each region trended upwards from the summer of 2009 through 2010. Job openings data for each region commenced downturns before downturns began in each region's CES employment data.⁶ (See chart 3.)

Job openings and unemployment. Job openings generally move inversely to unemployment. An economic expansion typically is characterized by low unemployment and a high level of job openings. An economic contraction is likely to be marked by high unemployment and a low number of job openings. Since the end of the most recent recession, the gap between the unemployment rate and the job openings rate has narrowed slightly. The difference between the unemployment rate and the job openings rate was 7.2 percent in December 2010, down from a high of 8.3 percent in October 2009. (See chart 4.)

Dividing the level of unemployment by the number of job openings results in a ratio which shows the number of job openings per unemployed person. This ratio reached its most recent low in late 2006 through early 2007. The ratio then began to climb from the onset of the 2007– 2009 recession until July 2009 when it reached a high of almost 7 unemployed persons per job opening. From July 2009 through April 2010, the ratio declined to 5 unemployed persons per job opening before leveling off throughout the remainder of 2010. (See chart 5.)

The Beveridge curve examines the inverse relationship between labor demand (as measured by the number of job openings) and labor supply (as measured by the number of unemployed people). Plotting the intersection of the job openings rate and the unemployment rate over time produces the Beveridge curve. The curve is downward sloping and reflects the state of the economy through comovement of these measures along their individual axes; there can be movements along the curve as well as shifts in the curve toward or away from the origin, which is at the intersection of the axes. (See chart 6.) High job openings and low unemployment result in a position high and to the left on the curve, and generally indicate a period of economic expansion. Low job openings and high unemployment result in a position low and to the right on the curve, and generally indicate a period of economic contraction.

Not only can points move along the curve, the curve itself can shift towards or away from its origin. Greater mismatch between available jobs and the unemployed because of skills mismatch or geographic disparity can cause the curve to shift away from the origin. Decreased job-matching efficiency results in both high unemployment and unfilled job openings. Improved matching of available jobs to unemployed people can cause the curve to shift towards the origin. Increased job-matching efficiency results in both lower unemployment and fewer unfilled job openings.

From the start of the recent recession in December 2007 through the middle of 2009, the economy's position along the Beveridge curve moved lower and farther to the right as the job openings rate declined and the unemployment rate rose. The lowest points on the curve reflect the JOLTS job openings series lows during the spring and summer

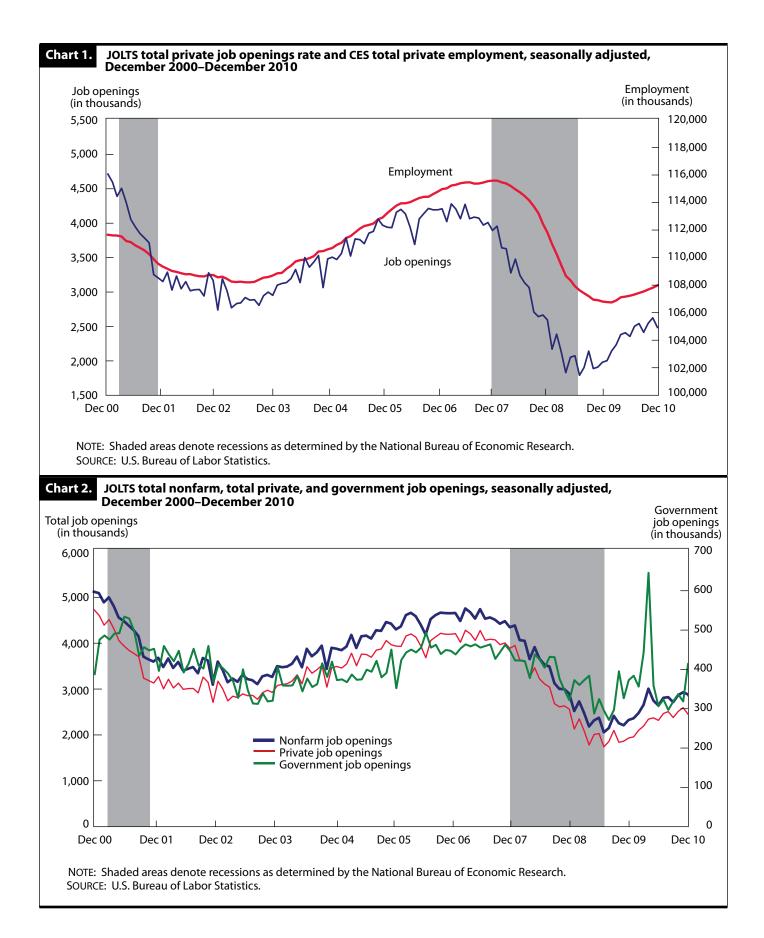

JOLTS program developments

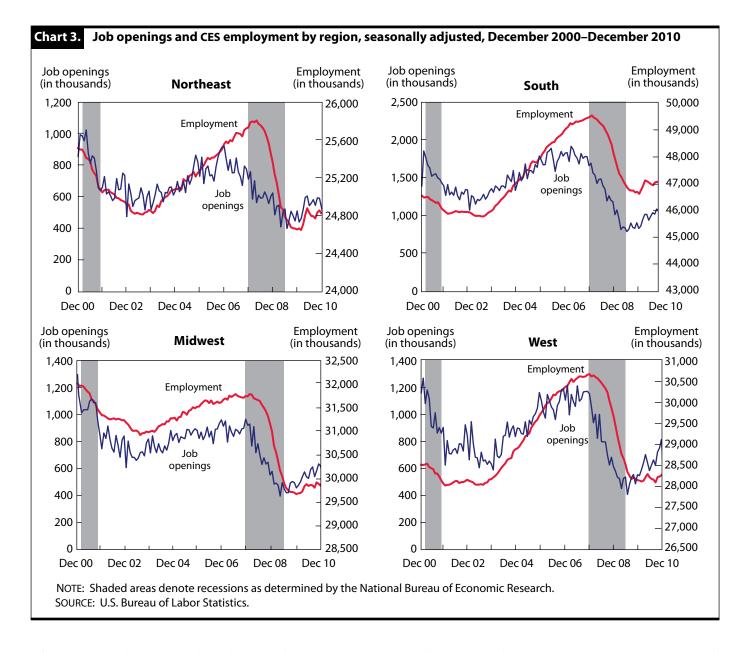

The following important developments took place in the JOLTS program in 2010:

- As of the publication of November 2010 estimates, the JOLTS program reached its tenth anniversary.
- The Bureau of Labor Statistics sponsored a JOLTS Symposium on December 10, 2010. Bringing together leading academic and policy users of JOLTS data, the symposium included the presentation of five research papers and concluded with a roundtable discussion of the program's strengths and weaknesses, as well as recommendations for the future of the JOLTS program.¹
- The JOLTS program began producing experimental estimates by size of nonfarm business establishment as the result of an initial request from the Department of Treasury. Experimental size class estimates are now available upon request by establishment size and data element.²

¹Richard L. Clayton, James R. Spletzer, and John C. Wohlford, "Conference Report: JOLTS Symposium," *Monthly Labor Review*, February 2011, pp. 41–47, http://stats.bls.gov/opub/mlr/2011/02/art4full.pdf (visited June 9, 2011).

For more information, see "Experimental JOLTS Estimates by Establishment Size Class," (U.S. Bureau of Labor Statistics, March 11, 2011), http://stats.bls.gov/jlt/sizeclassmethodology.htm (visited July 21, 2011).

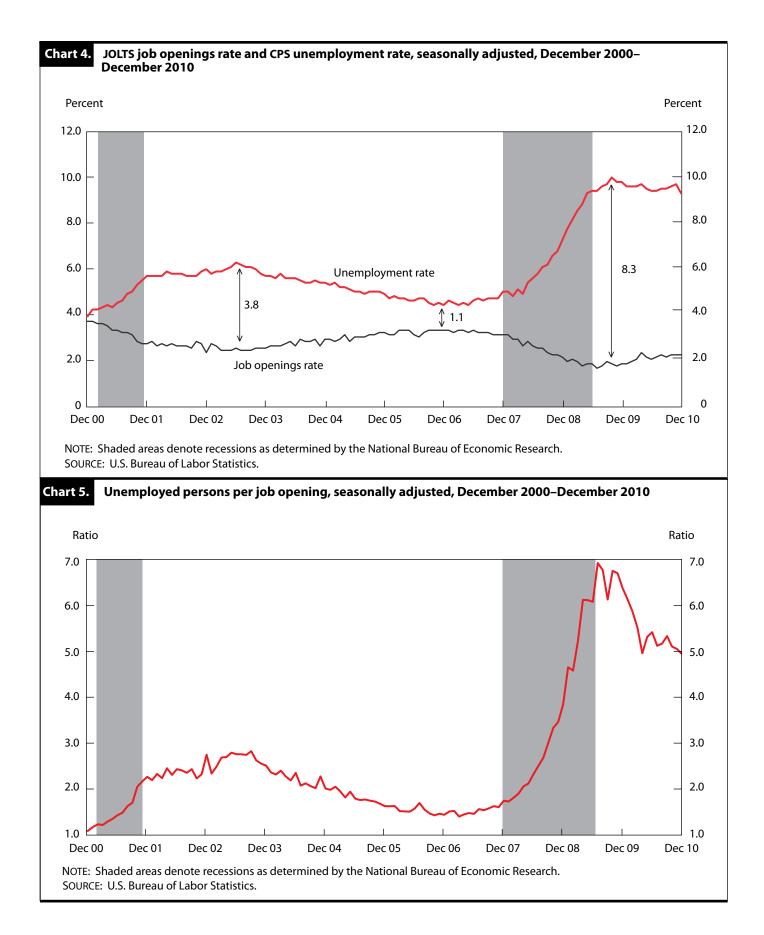

of 2009 in combination with high unemployment rates. During most of 2010, the points on the curve moved vertically as the job openings rate increased and the unemployment rate changed very little. Since mid-2010, however, the curve has moved erratically towards the left.

Analysis of the Beveridge curve has resulted in different theories about what the recent movements of the curve represent. The questions being asked are: Does the shape of the current Beveridge curve reflect structural changes or cyclical changes? Or, could these movements be a combination of both?

According to the cyclical viewpoint, movement of the economy along the Beveridge curve may have entered a circular pattern during the economic recovery. An article by Murat Tasci and John Lindner states that the economy may take time to adjust to changes in job openings and unemployment as it may take longer for unemployment to decline than for job openings to increase. This will cause the curve to shift outward temporarily, as it has done during other recovery periods. The delay in the response of unemployment to an improving economy could in part be due to reentry into the labor force of jobseekers who had left when the economy was in decline. This could mean the Beveridge curve may appear to undergo a structural shift when the movement is actually a cyclical one.⁷

Those who interpret the movement as a structural shift in the Beveridge curve note that there are increasing levels of both job openings and unemployment.⁸ Structural shifts can be industry-related or geography-related. For example, with an industry-based structural mismatch,

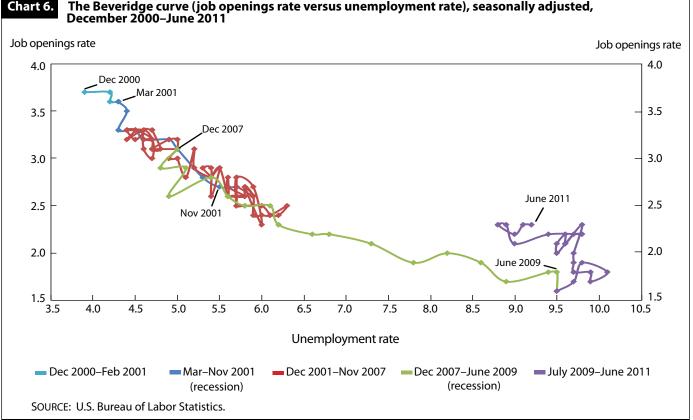

Chart 6. The Beveridge curve (job openings rate versus unemployment rate), seasonally adjusted,

there may be high unemployment in the construction sector but high demand for workers in the health care sector. The inability of jobseekers to sell a house in order to relocate to take a job could, on a large scale, create a geographic disparity; hence, high unemployment may persist because potential employees cannot move to fill positions.9

Rather than attribute the potential shift in the Beveridge curve to a skill mismatch at the sector level caused by oversupply (e.g., construction) or undersupply (e.g., health care), Dave Altig of the Federal Reserve Bank of Atlanta proposes that the potential shift may have been caused by changing needs at the business and individual industry level. While noting that substantiating data are scarce, Altig points to the possibility that productivity gains, which took place during the recession and into the recovery, have led to changes in business processes and hence the need for different skill sets.¹⁰

Alternatively, an article by Regis Barnichon, Michael Elsby, Bart Hobijn, and Aysegul Sahin suggests that vacancy yield deficits-that is, the relatively low level of hires per vacancy—are contributing to the possible shift in the Beveridge curve. While deficits in the vacancy yield were found across all industries, there are several industries that have particularly low yields. These industries are construction, transportation, trade, utilities, and

leisure and hospitality, with construction as the greatest contributor.¹¹ Possible explanations of the shortfall in the

Definitions of JOLTS terms

Job openings. Monthly job openings are defined as the number of openings on the last business day of the reference month.

Hires. Monthly hires are all additions of personnel to the payroll during the reference month, and annual hires are all additions to the payroll during a given year. The annual hires rate is calculated by dividing the total number of hires for the year by the average monthly employment for the year, and then multiplying the result by 100.

Total separations. Monthly total separations are defined as the number of employees separated from the payroll during the reference month, and annual total separations is the number separated during a given year. Separations are classified as quits, layoffs and discharges, and other separations. The annual total separations rate is calculated by dividing the number of total separations for the year by the average monthly employment for the year, and then multiplying the result by 100.

Quits. These are cases in which people left a job voluntarily but did not retire or transfer.

Layoffs and discharges. These are involuntary separations initiated by employers.

Other separations. These are defined as retirements, transfers, deaths, and separations caused by disability.

vacancy yield for these industries, according to the authors, are that there is a greater mismatch of occupation and location of the unemployed than in the past and firms may be recruiting less intensively to fill vacancies.

While some analysts cite cyclical movements and others cite structural shifts in the economy, it may be possible that the economy is moving from cyclical movement to structural mismatch,¹² or is experiencing a combination of both. If the economy were to move from cyclical movement to structural mismatch, it could be due to the lack of applicability of the skills within the unemployed labor pool. Cyclical movements on the Beveridge curve may also coincide with structural shifts in some sectors of the economy.¹³

Experimental estimates by size of establishment. The JOLTS program currently is generating an experimental size class series for research purposes. Following the approach used by Alan Krueger, job openings were aggregated into three categories: establishments with fewer than 50 employees, establishments with 50 to 249 employees, and establishments with greater than 249 employees.¹⁴ The job openings data, aggregated by size class, can be used to gauge the differing impact of economic cycles on small, medium, and large establishments.¹⁵ Chart 7 compares job openings through the use of the experimental size-class time series. Krueger notes that while job openings started to

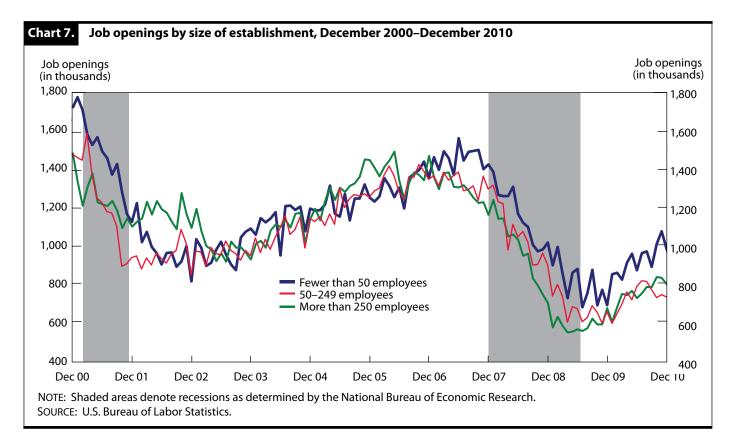

fall in early 2007, the job openings level for the largest establishments experienced its greatest drop at the onset of the financial crisis in 2008.¹⁶

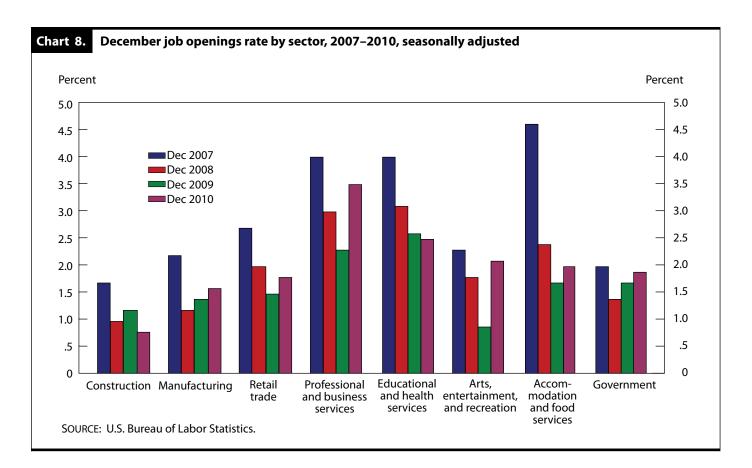

Industry data. At the sector level, all seasonally adjusted job openings trended down from the beginning of the recession and dropped to series lows in 2009. As shown in chart 8, every sector except construction and education and health services ended December 2010 with more job openings than at the end of December 2009. By December 2010, job openings had not reached the levels seen in December 2007 in any sector, although professional and business services, as well as arts, entertainment, and recreation, regained the most ground. Government job openings, which had experienced a relatively modest decline, were almost back to their December 2007 level.

Hires

The level of monthly hires hit a series low of 3.6 million in October 2009 before trending upward to reach 4.3 million in May 2010, its highest level in almost two years. Hires then declined and remained flat at 3.9 million during each month of the second half of the year. In contrast, at the onset of the recession in December 2007, the level was 5.0 million.

The annual hires rate in 2010 increased in all regions

except the West, where it was unchanged at 36.1 percent. Annual total hires increased from 45.4 million in 2009 to 47.2 million in 2010 after three straight years of decline. As shown in chart 9, the hiring of temporary workers for the decennial census caused the largest over-the-month spike in government hires since the data series began. The sharp decline in government hires the following month was primarily the result of discontinuing the hiring of temporary census workers.

The number of total private hires and the average weekly hours of private employees both declined during the recession and have remained well below their prerecession levels.¹⁷ Total private average weekly hours have trended upwards since hitting a series low in June 2009. In contrast, total private hires remained practically flat in 2010, hovering between 3.3 million and 3.8 million. (See chart 10.) The reluctance of private companies to hire may have been due to weak demand in the economy. Weak demand may also have resulted in lower average weekly hours than before the recession.¹⁸

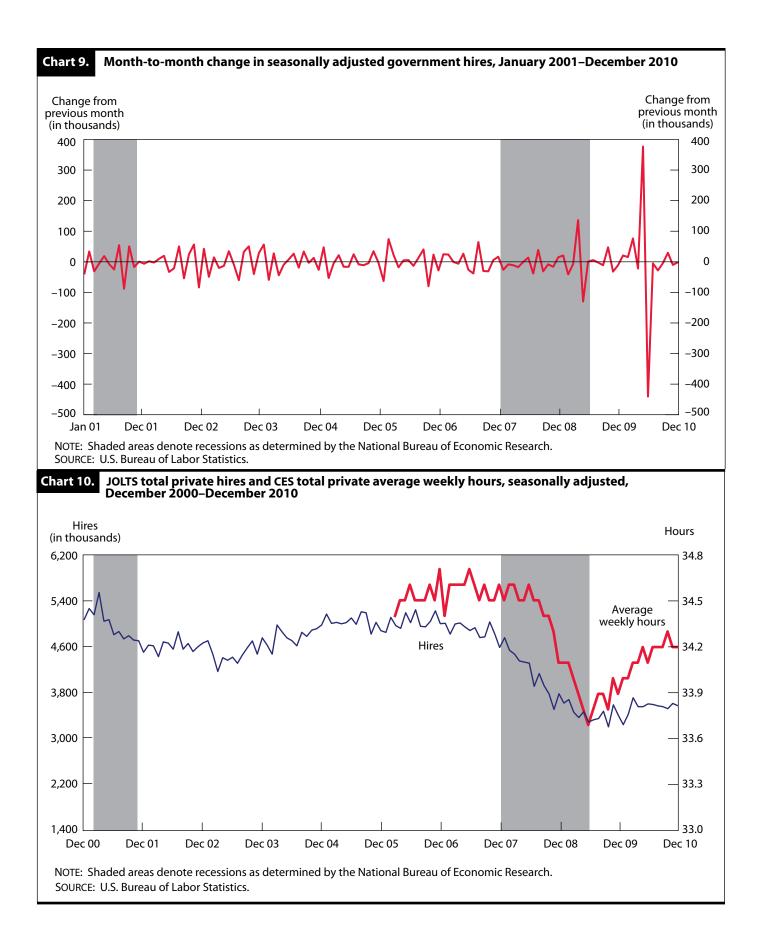

Hires by industry. Hires at the sector level show trends similar to the trend at the national level. Monthly data show that hires in most sectors increased during the first half of 2010. Hires in construction and retail trade re-

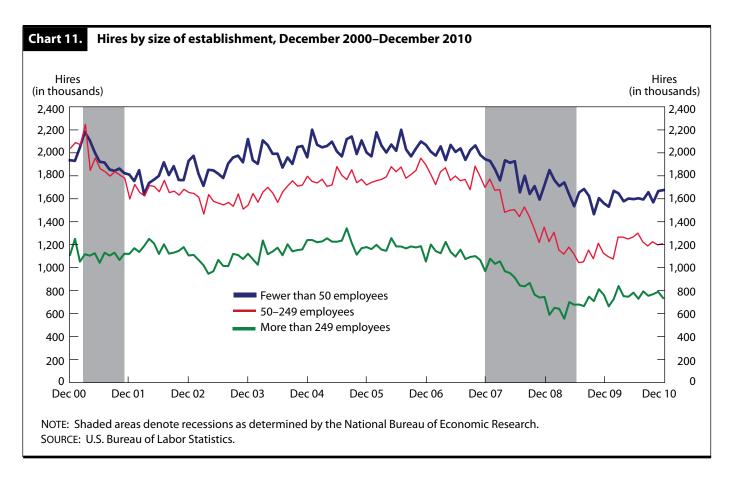

bounded in March 2010 to 382,000 and 618,000, respectively, their highest levels in more than a year. The upsurge in construction hires in March 2010 may be attributable to weather-related postponement of construction projects from the previous month. The increase in retail hires may reflect an increase in demand for workers in online sales.¹⁹ Education and health services peaked at 594,000 in January 2008 and reached a series low of 409,000 in January 2010. Annual hires data showed an almost even split of industries that experienced either a decline or an increase in hires for the year 2010.

Experimental estimates by size of establishment. Chart 11 compares hires by size of establishment. According to Alan Krueger, the divergence in hiring levels between large and small establishments was affected by the financial crisis in 2008. Smaller establishments initially reacted with layoffs and business closings. The first response of larger establishments was to freeze hiring.²⁰

Total Separations

Following the end of the recession in June 2009, the level of total separations continued its steep drop throughout the rest of the year. In 2010, monthly total separations

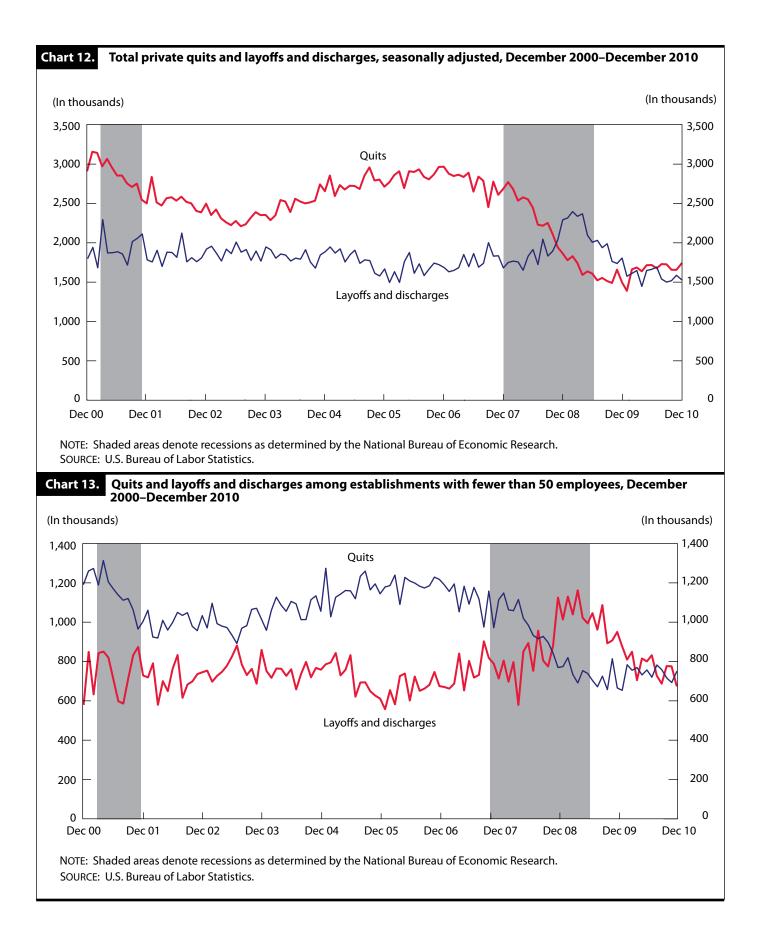

rollercoastered from a series low of 3.5 million in January to a high of 4.2 million in June, but decreased to 3.8 million at the end of the year. The annual total separations rate declined for the fifth straight year, ending 2010 at 35.7 percent. Total separations in government reached a series high of 554,000 in June 2010 as employment of census temporary workers declined considerably.

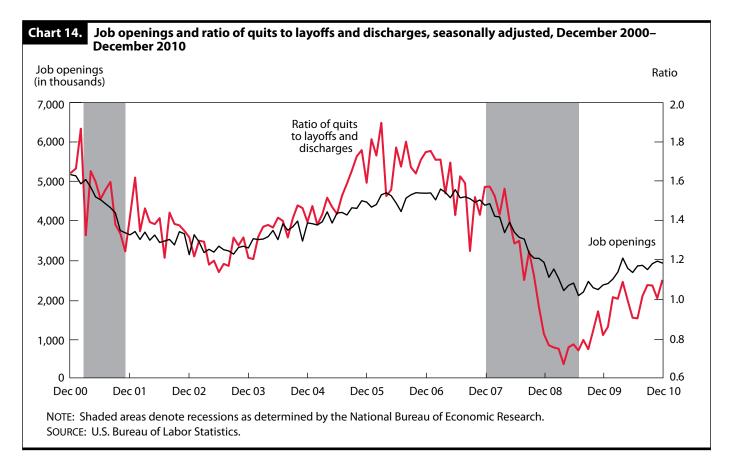

Components of total separations. Total separations are composed of quits, layoffs and discharges, and other separations. The gap between total private quits and total private layoffs and discharges consistently narrowed since the start of the recession until, by November 2008, there were fewer total private quits than total private layoffs and discharges for the first time ever in the JOLTS series. Total private quits again exceeded total private layoffs and discharges from February 2010 through the remainder of 2010 except for July, although the gap between the two series was minimal. (See chart 12.) By the end of 2010, total private quits had not yet returned to prerecession levels.

Experimental estimates by size of establishment. The trend of quits and of layoffs and discharges from establishments with fewer than 50 employees is quite similar to the trend

on the total private level. After the financial crisis that started in late 2008, layoffs and discharges for total private establishments as well as for those with fewer than 50 employees reached series highs during the first half of 2009 and declined steadily through 2010. Total private quits trended downward during the most recent recession, spiked briefly when the recession ended, and then remained practically flat throughout 2010. (See chart 13.)

The ratio of quits to layoffs and discharges can serve as a reflection of the general health of the labor market. The quits-to-layoffs ratio shown in chart 14 has trended with the job openings level for the duration of the JOLTS series. The ratio reached a series high of 1.9 in March 2006, the same time that job openings were near a series high. As more jobs began opening up, more people may have felt encouraged about quitting their job and finding a new one—in fact, the ratio indicates that almost twice as many people quit their jobs as were laid off. Conversely, as job openings plunged to new lows during the recession, the ratio decreased precipitously until reaching a series low of 0.7 in April 2009. With fewer job openings, more people may have tried to hang onto their jobs; this helped push the ratio to its lowest point ever. Both the ratio and job openings have trended upwards since then, but neither reached prerecession levels in 2010.

After most sectors experienced an increase in the annual number of layoffs and discharges from 2008 to 2009, the annual number decreased in each sector from 2009 to 2010. In contrast, layoffs and discharges in government more than doubled from May to June 2010, primarily because the services of most of the temporary census workers were no longer needed. Posting a 25 percent increase, finance and insurance had the largest growth in the annual number of quits; information showed the largest decrease, 11 percent. All industries except for retail trade and education and health services ended December 2010 with more quits than a year earlier. As with job openings and hires, quits in every sector had yet to reach prerecession levels by year end. JOLTS DATA SHOW THAT WHILE THE LABOR MARKET HAS IMPROVED since the most recent recession, gains have been small. Both the number of job openings and the number of hires declined from the months before the recession through the first half of 2009 and have since been climbing steadily but slowly. Total separations reached a series low at the onset of 2010 and, despite a brief upswing during the following months, ended the year at practically the same level as twelve months earlier. Levels for job openings, hires, and total separations did not meet prerecession levels through 2010 and have not met those levels as of the writing of this article. The impact of the 2010 decennial census on job openings, hires, and total separations was notable but brief.

Notes

depending on the context. In analyzing "industries," the JOLTS program follows the North American Industrial Classification System.

¹ See the September 20, 2010, report of the Business Cycle Dating Committee of the National Bureau of Economic Research, in which June 2009 was announced as a business cycle trough and the end of the recession that had begun in December 2007, http://www.nber.org/ cycles/sept2010.html (visited June 9, 2011).

² The term "industry" can refer to a supersector, sector, or subsector,

Employment dynamics over the last decade

Business cycle movements in BED and JOLTS data suggest that the two series complement each other; during the onset of the 2007–2009 recession, BED gross job gains and JOLTS hires fell simultaneously while BED gross job losses and JOLTS separations diverged

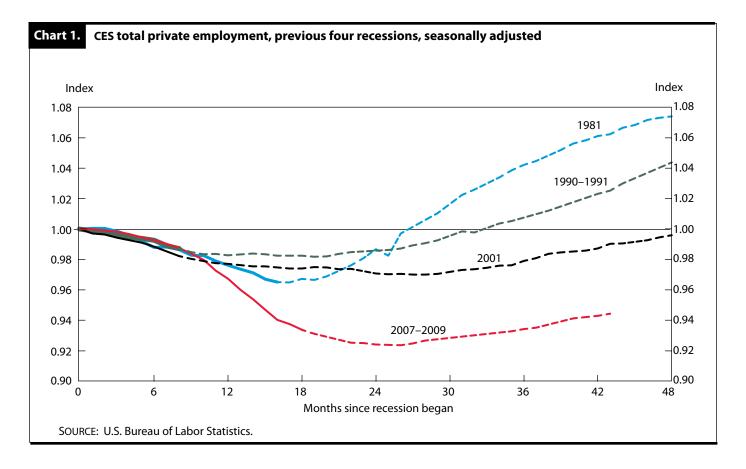

Caryn N. Bruyere, Guy L. Podgornik, and James R. Spletzer

Caryn N. Bruyere, Guy L. Podgornik, and James R. Spletzer are economists in the Office of Employment and Unemployment Statistics, Bureau of Labor Statistics. Email: bruyere.caryn@ bls.gov, podgornik.guy@bls.gov, or spletzer.jim@bls.gov he 2007–2009 recession was the longest and most severe post-World War II recession. As dated by the National Bureau of Economic Research (NBER), the recession was 18 months long, lasting from December 2007 through June 2009. Prior to that, the longest post-World War II recessions were the 1973 and 1981 recessions, both 16 months long.

The employment losses associated with the 2007-2009 recession also were the largest of any post-World War II recession. Twenty-six months after the recession began, total private employment was 7.6 percent lower than it was at the start of the recession.¹ Prior to this recession, the largest employment loss in any post-World War II recession was 6.0 percent, posted 11 months after the start of the 1948 recession. Looking at the four most recent recessions reveals that the maximum total private employment losses were the aforementioned 7.6 percent for the 2007–2009 recession, 3.5 percent for the 1981 recession, 3.0 percent for the 2001 recession, and 1.8 percent for the 1990–1991 recession. The time series of total private employment for the 4 years following the onset of the most recent four recessions are presented in chart 1. The severity of employment losses in the most recent recession relative to other recent recessions is clear.

This article examines the underlying dynamics of the employment losses associated with the 2007-2009 recession. The data graphed in chart 1 summarize the net employment losses that originate from the hiring, quit, and layoff decisions of more than 8.5 million establishments and more than 100 million workers in the private sector. One measure of the underlying employment dynamics is to simultaneously count how many jobs are being created by establishments that are opening or increasing their employment and how many jobs are being lost by establishments that are closing or decreasing their employment. The sum of these two statistics will be the net employment change. Another measure of the underlying employment dynamics is to simultaneously count how many workers are being hired and how many workers are leaving their current employer. Again, the sum of these two statistics will be the net employment change. Both of these measures of the underlying employment dynamics of the labor market can be examined with data from two programs conducted by the Bureau of Labor Statistics (BLS, the Bureau): the Business Employment Dynamics (BED) program and the Job Openings and Labor Turnover Survey (JOLTS).

BED data measure the gross job gains registered by expanding and opening establishments and the gross job losses posted by contracting and closing establishments. Gross job

gains and losses, also referred to as *job flows*, measure the establishment-level net changes in employment that underlie the single, economywide net-employment-change statistic. JOLTS data measure the number of workers hired into jobs and the number of workers separating from their employer. These hires and separations data, also referred to as *worker flows*, measure the underlying employment dynamics from the worker's perspective.

Measures of gross job gains and gross job losses from the BED statistics and measures of hires and separations from the JOLTS help explain why employment is increasing or decreasing. For example, labor market analysts often ask what portion of the job losses during the most recent recession was due to businesses laying off workers, as opposed to businesses not replacing workers who quit or retired. In addition, analysts are concerned that employment may not grow quickly as the economy emerges from the recent recession: is it because businesses are not hiring or because workers are still losing their jobs? The measures of employment dynamics from the BED statistics and the JOLTS are intended to answer this and other types of questions.

In what follows, levels and trends in gross job flows

from the BED statistics are compared with levels and trends in worker flows captured by the JOLTS.² The analysis finds that both the BED statistics and the JOLTS measure large amounts of employment dynamics that underlie the single net-change statistic and that both the BED statistics and the JOLTS have business cycle properties. The most important finding, however, is that the BED statistics and the JOLTS data are complementary and measure different aspects of the labor market. For example, the rise in establishment-level employment losses that the BED statistics show in the early stages of the most recent recession reflect an initial decrease in hiring, followed several quarters later by a large increase in layoffs, as revealed by the JOLTS data. Analogously, the increase seen in the BED establishment-level employment gains following the trough of the most recent recession reflects primarily a decrease in the number of layoffs, as indicated in the JOLTS data.

Employment dynamics data

This section describes (1) the gross job gains and gross job losses exhibited in the BED statistics and (2) the hires and separations data collected by the JOLTS. The next section compares and contrasts the BED job flows and the JOLTS worker flows. Business employment dynamics. The BED microdata are constructed from the Quarterly Census of Employment and Wages (QCEW) microdata at the Bureau of Labor Statistics. The QCEW is the Bureau's business list, with employment and wage information for all establishments covered by State and Federal unemployment insurance laws. The 9-million-plus establishments that participate in the QCEW cover 98 percent of employees on nonfarm payrolls in the United States; thus, the QCEW is a near census of U.S. payroll employment. (Self-employed individuals are excluded.)

BED microdata are created by linking the establishments in the QCEW longitudinally across quarters. Establishments in the government sector and in the private household services industry are excluded from the BED data. Through the process of linking establishments between the previous and the current quarter, five categories emerge: opening establishments have positive employment in the current quarter, but either did not exist or had zero employment in the previous quarter; expanding establishments have positive employment in both quarters, with employment in the current quarter higher than employment in the previous quarter; contracting establishments have positive employment in both quarters, with employment in the current quarter less than employment in the previous quarter; and *closing* establishments had positive employment in the previous quarter, but either do not exist or have zero employment in the current quarter. A fifth category comprises establishments that have the same level of employment in both the current and the previous quarter. Gross job gains are defined as the number of jobs created by opening and expanding establishments, and gross job losses are defined as the number of jobs lost from contracting and closing establishments. The difference of gross job gains and gross job losses is the familiar net employment change statistic.³

The Bureau releases BED statistics quarterly. The core data elements in the release are gross job gains and gross job losses, along with the associated establishment counts, by industry, State, age, and size of firm. In the fourth quarter of 2010, the most recent period for which data are available, gross job gains were 6.954 million and gross job losses were 6.391 million, resulting in a net employment growth of 563,000 for the quarter.⁴

The time series of quarterly BED statistics starts in the third quarter of 1992. Seasonally adjusted gross job gains and gross job losses from 1992 to 2010 are presented in chart 2, and the resulting net employment change statistics (computed as gross job gains less gross job losses) are shown in chart 3.

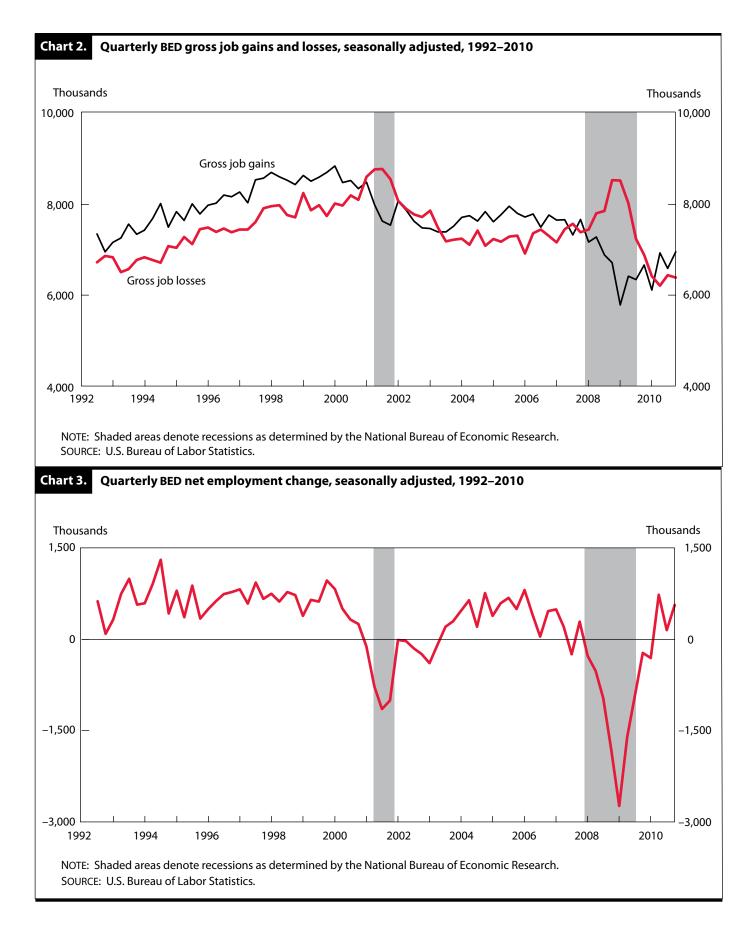

The BED statistics reflect two major facts about the

U.S. labor market. First, as seen in chart 2, there is a large amount of establishment-level churning that is not evident in the statistics on net employment change. To bring out this point more clearly, table 1 presents averages of the seasonally adjusted quarterly BED statistics for the years 2004–2007. In the average quarter of this period, there were 1.540 million establishments that were expanding, and these expanding establishments created 6.197 million jobs. Also during the average quarter of this period, there were 365,000 establishments that were opening, and these opening establishments started with 1.503 million jobs. The sum of these two statistics shows that, in the average quarter, there were 1.905 million establishments that created 7.700 million jobs which did not exist in the previous quarter. The gross job loss statistics are in the bottom half of the table, and they show a similar story: in the average quarter, there were 1.869 million establishments that were contracting or closing and 7.282 million jobs that existed in the previous quarter no longer existed in the next quarter. The net of gross job gains and gross job losses was 418,000 net new jobs created in the average quarter (during the years 2004–2007).

Digging somewhat deeper into gross job gains and gross job losses, chart 4 shows the decomposition of gross job gains into expansions and openings and the decomposition of gross job losses into contractions and closings. In the chart, the quarterly gross job gains and losses from expanding and contracting establishments are seen to be much larger than the quarterly gross job gains and losses from opening and closing establishments. Throughout the 18-year time series of the BED (from the third quarter of 1992 to the fourth quarter of 2010), 79 percent of quarterly gross job gains are from expanding establishments and 80 percent of quarterly gross job losses are from contracting establishments.

The second major conclusion to be drawn from the BED statistics is that gross job gains and gross job losses have interesting business cycle properties. As seen in chart 2, simultaneous sharp rises in jobs lost from contracting and closing establishments and drops in jobs gained from expanding and opening establishments occur during recessions. Examining chart 4 suggests that most of the interesting business cycle dynamics associated with gross job gains and gross job losses are concentrated in the expanding and contracting establishments, as opposed to the opening and closing establishments.

In addition to disseminating statistics on gross job gains and losses, the BED program publishes the number of establishments gaining and losing jobs. These establishment counts are presented in chart 5, which shows that, during

Monthly Labor Review • August 2011 19

| Table 1.BED statistics in the average quarter, 2004–2007 | | | | | |
|--|--------------------------|----------------------------------|--|--|--|
| Statistic | Number of establishments | Number of jobs gained or lost | | | |
| Expanding establishments | 1,540,000 | 6,197,000 jobs gained | | | |
| Opening establishments | 365,000 | 1,503,000 jobs gained | | | |
| Gross job gains | 1,905,000 | 7,700,000 jobs gained | | | |
| Contracting establishments | 1,524,000 | 5,889,000 jobs lost | | | |
| Closing establishments | 345,000 | 1,393,000 jobs lost | | | |
| Gross job losses | 1,869,000 | 7,282,000 jobs lost | | | |
| Net change in employment | | 418,000 net jobs gained | | | |

the most recent recession, the number of establishments gaining jobs declined and the number of establishments losing jobs increased. Further calculations (explained in the box on page 22) reveal that approximately two-thirds of the sharp decrease in gross job gains between the fourth quarter of 2007 and the first quarter of 2009 is attributable to a decrease in the number of establishments gaining jobs, with the remaining one-third attributable to a decrease in the average number of jobs created by job-creating establishments. These statistics suggest that the falling gross job gains are due both to establishments eliminating their hiring and to establishments cutting back on their hiring, with twice as much explanatory weight given to the former. Similar calculations show that approximately two-thirds of the sharp increase in gross job losses between the fourth quarter of 2007 and the first quarter of 2009 is attributable to an increase in the number of establishments losing jobs, with the remaining one-third attributable to an increase in the average size of jobs lost per declining establishment.

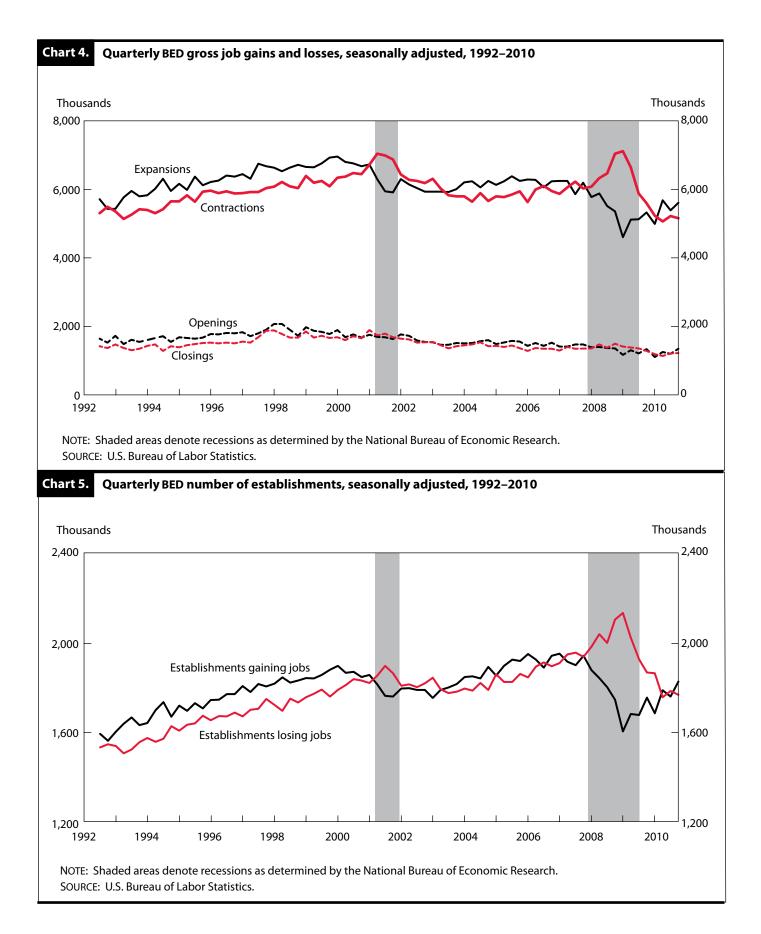

Job Openings and Labor Turnover Survey. The JOLTS is composed of a random sample of approximately 16,000 business establishments, of which approximately 10,500 provide data on a regular basis. The establishments are sampled from the BLS business universe: the QCEW. The JOLTS collects information on total employment, job openings, hires, and separations. The separations data are collected as quits, layoffs and discharges, and other separations. The key component of the JOLTS form is shown in exhibit 1.5

The JOLTS total employment estimates are benchmarked monthly to the employment estimates of the Current Employment Statistics (CES) survey, and the ratio of CES to JOLTS employment is used to adjust the levels for all other JOLTS data elements. After the benchmarking of the monthly employment levels, the JOLTS implied net employment change (hires minus separations) should be comparable to the CES net employment change. However, definitional differences, as well as sampling and nonsampling errors between the two surveys, historically have caused the JOLTS to diverge from the CES survey over time. To limit this divergence, and to improve the quality of the JOLTS hires and separations series, the Bureau implemented a monthly alignment method that applies the CES employment trends to the seasonally adjusted JOLTS implied employment trend, forcing them to be approximately the same. The CES series is considered a highly accurate measure of net employment change, owing to its very large sample size and annual benchmarking to universe counts of employment from the QCEW program.⁶

The JOLTS statistics released monthly by the Bureau include hires, separations, and job openings, by industry and region. In June 2011, the most recent period for which data are available, there were 4.051 million hires and 4.016 million separations, with a resulting net employment change of 35,000 jobs.⁷

The time series of monthly JOLTS statistics starts in December 2000. In everything that follows in this article, quarterly JOLTS data are created from the monthly data and the focus is on the private sector for the first quarter of 2001 through the fourth quarter of 2010. A time series of quarterly JOLTS data for the private sector allows for a straightforward comparison of the BED and JOLTS data. The measure of quarterly hires is created as the sum of three monthly hires, and the measure of quarterly separations is created as the sum of three monthly separations. The quarterly JOLTS hires and separations statistics for the private sector are presented in chart 6, and the resulting net employment change statistics (computed as hires less separations) are given in chart 7. The quarterly components of separations-quits, layoffs, and other separations—are shown in chart 8.

The JOLTS hires and separations statistics tell us two major facts about the U.S. labor market. First, there is a tremendous amount of worker churning in the labor market that is not evident in the net employment change statistics. To show this phenomenon more clearly, the following tabulation presents quarterly averages of the

Gross job gains from the fourth quarter of 2007 to the first quarter of 2009: why the decrease?

The number of gross job gains in the fourth quarter of 2007 (G^{07}) was 7.670 million, calculated as 1.945 million establishments gaining jobs (E^{07}) times an average size of 3.94 jobs gained per establishment (S^{07}). The number of gross job gains in the first quarter of 2009 (G^{09}) was 5.783 million, calculated as 1.606 million establishments gaining jobs (E^{09}) times an average size of 3.60 jobs gained per establishment (S^{09}). During that period, both the number of establishments gaining jobs decreased (from 1.945 million to 1.606 million) and the average size of job gains in gaining establishments decreased (from 3.94 to 3.60). How much of the total decline in gross job gains (from 7.670 million to 5.783 million) was due to each of these components?

There are two ways to decompose the difference G^{07} - G^{09} . The first is

$$\begin{split} G^{07} - \ G^{09} &= E^{07} S^{07} - E^{09} S^{09} \\ &= E^{07} S^{07} - E^{09} S^{09} + E^{07} S^{09} - E^{07} S^{09} \\ &= E^{07} (S^{07} - S^{09}) + S^{09} (E^{07} - E^{09}). \end{split}$$

The term $E^{07}(S^{07} - S^{09})$ is referred to as the *aver-age-size effect* and is computed as 1.945(3.94 - 3.60) = 0.666. The term $S^{09}(E^{07} - E^{09})$ is referred to as the *number-of-establishments effect* and is computed as 3.60(1.945 - 1.606) = 1.221. These two effects (0.666 + 1.221 = 1.887) sum to the total number of jobs gained ($G^{07} - G^{09}$) = (7.670 - 5.783) = 1.887. In this first decomposition, the average-size effect is 35.3 percent of

the total effect and the number-of-establishments effect is 64.7 percent of the total effect.

The second way to decompose the difference $G^{07} - G^{09}$ is

$$\begin{split} G^{07}-\ G^{09} &= E^{07}S^{07}-E^{09}S^{09} \\ &= E^{07}S^{07}-E^{09}S^{09}+E^{09}S^{07}-E^{09}S^{07} \\ &= E^{09}(S^{07}-S^{09})+S^{07}(E^{07}-E^{09}). \end{split}$$

The average-size effect $E^{09}(S^{07} - S^{09})$ is computed as 1.606(3.94 - 3.60) = 0.550. The number-of-establishments effect $S^{07}(E^{07} - E^{09})$ is computed as 3.94(1.945 - 1.606) = 1.337. These two effects (0.550 + 1.337) sum to the total number of jobs gained, 1.887. In this second decomposition, the average-size effect is 29.2 percent of the total effect and the number-of-establishments effect is 70.8 percent of the total effect.

Although the two different decompositions fail to give the exact same point estimates for the average- size effect (35.3 percent and 29.2 percent) and for the number-of-establishments effect (64.7 percent and 70.8 percent), it is clear that approximately two-thirds of the sharp decrease in gross job gains between the fourth quarter of 2007 and the first quarter of 2009 is attributable to a decline in the number of establishments gaining jobs, with the remaining one-third attributable to a decline in the average number of jobs created by job-creating establishments.

seasonally adjusted quarterly JOLTS statistics for the years 2004–2007:

| Statistic | Number of jobs |
|--------------------------|----------------|
| Hires | 14,821,000 |
| Separations | 14,387,000 |
| Quits | |
| Layoffs | 5,301,000 |
| Other | 928,000 |
| Net change in employment | 434,000 |

As the tabulation shows, in this period's average quarter 14.821 million workers were hired into new jobs and

14.387 million workers were separated from their current jobs. Looking more closely at the separations data shows that, in the average quarter from 2004 to 2007, 8.158 million workers quit, 5.301 million workers were laid off, and 0.928 million workers were separated for other reasons, such as retirement. The net employment change resulting from the 14.821 million hires and the 14.387 million separations was 434,000 net new jobs created in the average quarter of the period.

The second major conclusion to draw from the JOLTS statistics is that hires and separations have business cycle properties. As seen in chart 6, both hires and separations fall during recessions, although hires fall faster. The growing divergence between the two series leads to the rising net employment losses evident in chart 7.⁸ The decline

in separations during recessions is different from the increase in BED gross job losses during recessions, and this difference is one of the key results highlighted in the next section.

The decline in JOLTS separations during recessions masks different trends in the underlying quits and layoffs. As seen in chart 8, quits fell dramatically during the last two recessions and layoffs rose for some time during the latter half of the most recent recession. The behavior of these series suggests a general model according to which the levels of hires and the levels of job openings both fall during recessions as establishments cut back on hiring or implement hiring freezes. Workers see this decline in labor demand and stay in their existing jobs; thus, quits fall. As the recession deepens, and as establishments want to cut back further on employment, the only option left when workers fail to quit is for establishments to begin laying them off.

The business cycle properties of the hires and separations series also can be seen by looking at correlations of the JOLTS data elements.⁹ The correlations of the quarterly JOLTS data elements, computed over the period from the first quarter of 2001 to the fourth quarter of 2010, are given in table 2. The correlation of 0.53 between hires and net change in employment indicates that the JOLTS hires series is procyclical: hires are growing when employment is growing (expansions), and hires are falling when employment is falling (recessions). Separations are mildly procyclical: the correlation of 0.14 between separations and net employment growth indicates that separations move somewhat together with net employment change. This mild procyclicality of separations is due to a procyclical quits series and a countercyclical layoffs series. Indeed, the correlation between layoffs and net employment growth is very strongly negative (-0.76).

It is worth noting the extremely strong correlation (0.97) between hires and quits. When establishments are hiring, workers see these opportunities and are more likely to quit their current jobs. During recessions, when establishments are not hiring, such opportunities are limited and workers are less likely to quit the jobs they have. However, it is important to note that, even during the trough of the most recent recession, there were still a large

number of hires and quits in the U.S. labor market. In the private sector, in the first quarter of 2009, when the number of jobs fell by 2.25 million (as measured by the JOLTS), there were still 10.9 million hires and 5.3 million quits. These statistics show that hires and quits did not come to a complete standstill during the most recent recession, although the respective numbers were certainly much lower than their average quarterly levels of 14.8 million hires and 8.2 million quits during the mid-2000s expansion. (See the tabulation on page 22.)

Employment dynamics during the last decade

This section compares and contrasts the BED and JOLTS statistics. Levels and trends during three periods are examined: the expansionary period of the mid-2000s, the onset of the most recent recession, and the quarters following the labor market trough of the recession.

The expansion. Chart 9 graphs BED gross job gains and gross job losses from the first quarter of 2004 through the fourth quarter of 2010, together with JOLTS hires and separations over the same period. As the chart shows, the BED

and JOLTS series were relatively stable during calendar years 2004–2007. BED gross job gains have an average quarterly level of 7.7 million during this period, and BED gross job losses have an average quarterly level of 7.3 million. JOLTS average quarterly hires are 14.8 million over the same period, and JOLTS average quarterly separations are 14.4 million. The ratio of hires to gross job gains is 1.93:1, and the ratio of separations to gross job losses is 1.98:1.

The onset of the recession. The NBER dated the most recent recession as having begun in the fourth quarter of 2007. From then until the first quarter of 2009, the labor market worsened. Following a net employment gain of 210,000 in the fourth quarter of 2007 (as measured by the CES total private employment series), quarterly employment losses began and then increased every quarter, from -211,000 in the first quarter of 2008 to -2,349,000 in the first quarter of 2009. A vertical line in chart 9 marks the first quarter of 2009 as the labor market trough.

As documented in the previous section, declining employment levels during the onset of recessions are characterized by falling gross job gains and rising gross job losses. BED gross job gains fell from 7.670 million in the

Hires and separations correlations from JOLTS quarterly data, first quarter, 2001, through fourth quarter, 2010

| Statistic | Hires | Separations | Quits | Layoffs | Net change in employment |
|--------------------------|-------|-------------|-------|---------|-----------------------------|
| Hires | 1.00 | 0.91 | 0.97 | -0.16 | 0.53 |
| Separations | | 1.00 | .94 | .19 | .14 |
| Quits | | | 1.00 | 14 | .40 |
| Layoffs | | | | 1.00 | 76 |
| Net change in employment | | | | | 1.00 |

fourth quarter of 2007 to 5.783 million in the first quarter of 2009 (a 24.6-percent decline), and BED gross job losses rose from 7.384 million to 8.524 million over the same period (a 15.4-percent increase). The period also is characterized by falling hires and falling separations. The JOLTS measure of hires fell by 24.5 percent, from 14.472 million at the beginning of the period to 10.925 million at the end, and the JOLTS measure of separations fell by 7.3 percent, from 14.215 million to 13.173 million.

It makes sense that BED gross job gains and JOLTS hires fall simultaneously. Gross job gains measure establishment-level increases in employment, and the only way that an establishment can grow is to hire personnel. When hires decline dramatically, as they did in the NBERdefined recessionary period, it follows that gross job gains also decline. What is less intuitive is that BED gross job losses are rising while JOLTS separations are falling. Gross job losses measure establishment-level decreases in employment, so it may be initially puzzling how establishments can decrease their employment without an increase in worker separations.

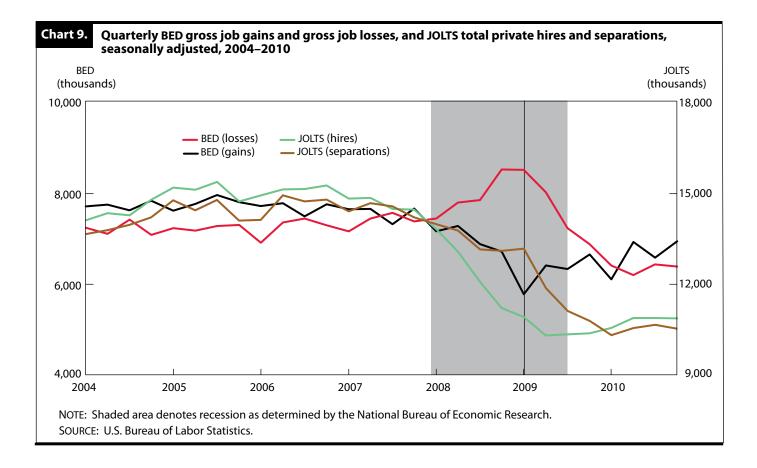

The explanation for this phenomenon is decreased hiring. Establishments can decrease their employment in two ways: by increasing separations (such as laying off workers or offering incentives for workers to retire) and by not hiring replacement workers for those workers who quit or retire. As documented earlier, there is a substantial number of separations (quits and layoffs) in both expansionary times and recessionary times. If separations remain at the same level or decrease mildly while the level of hires declines rapidly as establishments decide not to replace the workers who quit or retire, establishment employment will decrease and gross job losses will increase. This is a likely explanation for what happened during the recent recession.

But the story of what actually happened then is more

complicated. The complexity becomes evident when one looks at chart 10, which graphs JOLTS quits and layoffs instead of separations. Quits and layoffs are two of the three components of separations; the third component, "other separations" (that is, retirements) is not graphed because, as seen in chart 8, it does not exhibit much cyclical variation relative to quits and layoffs.

Chart 10 shows some intriguing labor market dynamics during the onset of the 2007–2009 recession. The level of hires began falling considerably in the first quarter of 2008, and quits experienced a similar large decline one quarter later. The level of hires hit a trough in the second quarter of 2009, and the level of quits did so one quarter later. Layoffs were constant during the first several quarters of the recession and then spiked upward in the fourth quarter of 2008 and the first quarter of 2009. For the first time in the history of the JOLTS (which started in December 2000), the number of layoffs exceeded the number of quits (in the fourth quarter of 2008). It is interesting to note that the increase in layoffs roughly matches the decline in quits in the fourth quarter of 2008 and the first quarter of 2009, leaving total separations essentially flat during those quarters.

In terms of economics, the following scenario about establishments that were downsizing is plausible: During the first several quarters of the recession, both hires and quits were falling rapidly and large increases in layoffs had not yet started. The moderate rise in gross job losses during these quarters appears to be due to hires falling more rapidly than quits. Then, in the fourth quarter of 2008 and the first quarter of 2009, layoffs increased dramatically while hires and quits were still falling rapidly. This increase in layoffs signaled the point in the recession at which decreased hiring no longer appeared to serve as a viable tool through which establishments could reduce their employment levels. Further contraction in establishment-level

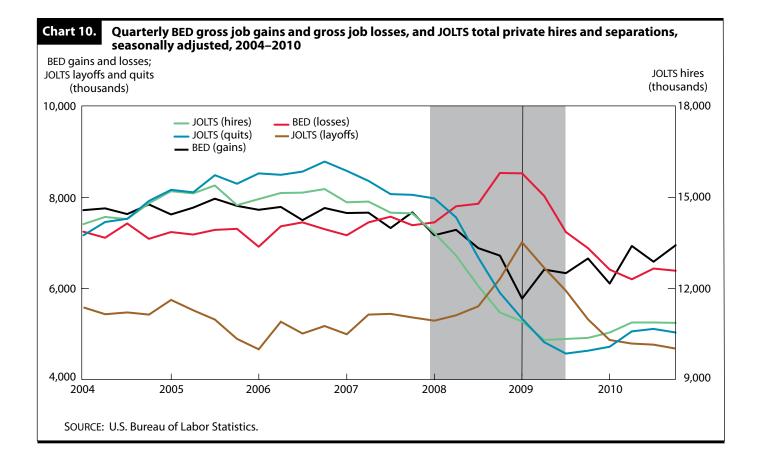

employment—the increase in gross job losses—was then driven by increased layoffs.

After the trough. Following the first quarter of 2009, the labor market began to improve. Quarterly net employment losses in the private sector, as measured by the CES, moderated in every quarter, from -2,349,000 in the first quarter of 2009 to -386,000 in the fourth quarter of that year. Quarterly net employment growth then turned positive in all four quarters of 2010.

The improving labor market during the period from the first quarter of 2009 to the second quarter of 2010 is characterized by a steep decline in gross job losses and a rise in gross job gains. (See chart 9.) During this period, BED gross job losses fell by 2.317 million (from 8.524 million to 6.207 million, a 27.2-percent decrease) and BED gross job gains rose by 1.152 million (from 5.783 million to 6.935 million, a 19.9-percent increase). The posttrough period from the first quarter of 2009 to the second quarter of 2010 is also characterized by falling separations and relatively stable hires. The JOLTS measure of separations fell by 19.8 percent (from 13.173 million to 10.566 million), and the JOLTS measure of hires fell by 0.4 percent (from 10.925 million to 10.886 million). The two BED measures and the quarterly JOLTS separations series appear to have been at turning points in the first quarter of 2009, whereas the quarterly JOLTS hires series reached its turning point one quarter later. Looking at the period from the second quarter of 2009 to the same quarter a year later, rather than at the period from the first quarter of 2009 to the second quarter of 2010 indicates that JOLTS hires grew by 5.5 percent (from 10.316 million to 10.886 million).

In terms of employment dynamics, the period from the first quarter of 2009 to the second quarter of 2010 has similarities to that from the fourth quarter of 2007 to the first quarter of 2009, but with key components of growth and decline reversed. During the onset of the recession, BED gross job gains and JOLTS hires—the two growth components of net employment change—fell simultaneously, whereas BED gross job losses and JOLTS separations—the two measures of decline in net employment change—diverged, with gross job losses increasing while separations fell. Following the trough of the recession, BED gross job losses and JOLTS separations fell simultaneously, whereas BED gross job gains and JOLTS hires diverged somewhat. After the trough, gross job gains increased by 1.152 mil-

lion over the period from the first quarter of 2009 to the second quarter of 2010 while hires grew by 0.570 million over the period from the second quarter of 2009 to the second quarter of 2010.

It makes sense that BED gross job losses and JOLTS separations decline simultaneously. Gross job losses measure establishment-level decreases in employment, and separations are one of two ways that an establishment can contract (the other being attrition—not hiring to replace workers who quit or retire). When separations decline as dramatically as they did from the first quarter of 2009 to the first quarter of 2010, it follows that gross job losses also will decline. What is more difficult to understand is how BED gross job gains can rise significantly despite a much smaller increase in JOLTS hires.

The large absolute numbers of hires and separations at any point in time—even in deep recessions—are the key to understanding the somewhat divergent trends of BED gross job gains and JOLTS hires in the period from the first quarter of 2009 to the second quarter of 2010. As a simple example, consider an establishment with 100 employees, and assume that, historically, this establishment has averaged 10 quits or retirements every quarter and always has hired 10 new workers to replace these separations. If separations decline from 10 to 5, and the establishment still hires 10 workers, then the establishment has grown from 100 to 105, even though it did not increase its level of hires. With a steady positive level of hires, a decrease in separations leads to an increase in establishment-level employment and thus an increase in gross job gains. The BED and JOLTS data shown in chart 9 suggest that, following the labor market trough, establishments were expanding by keeping their hiring at a relatively steady level while simultaneously decreasing separations.

The large decrease in separations from the first quarter of 2009 to the first quarter of 2010 reflects primarily a decrease in layoffs. During that period, separations fell by 2.852 million and layoffs dropped by 2.138 million. As chart 10 shows, in calendar year 2010 layoffs fell to just under 5 million per quarter, a level below their prerecessionary average. Quits fell during the first three quarters of 2009, from 5.341 million in the first quarter of that year to 4.582 million in the third quarter; then they began to increase, rising to a level of 5.061 million in the second quarter of 2010. (See chart 10.)

The increase in quits during the first half of 2010 war-

rants further mention. Following the series low in the third quarter of 2009, quits rose by 424,000 during the first two quarters of 2010. This increase was undoubtedly spurred by an increase in job openings, which hit a series low of 5.828 million in the fourth quarter of 2009 and then grew by 1.361 million during the first two quarters of 2010. Furthermore, hires rose by 499,000 during the first two quarters of 2010. When establishments want to start hiring following a recessionary trough, they post job openings and begin hiring. Meanwhile, workers start quitting their current jobs when they are hired into the newly created jobs. The fact that the increase in job openings is much higher than the increase in both hires and quits suggests that establishments are posting job openings yet not hiring to fill them. Nevertheless, this simultaneous rise in job openings, hires, and quits suggests

that the underlying components of employment growth dynamics were beginning to increase in 2010 after having recorded their recessionary lows in the last two quarters of 2009.

BED AND JOLTS DATA WERE FIRST PUBLISHED in 2003 and 2004, respectively. Both have informed analysts about the large amount of labor market churning that underlies the conventional net change in employment. BED and JOLTS data also exhibit business cycle properties, although the components of the BED and JOLTS series don't always move together during recessions. The business cycle movements in BED and JOLTS data suggest that the two series complement, rather than replicate, each other. Analyzed together, BED and JOLTS statistics increase our understanding of employment dynamics in recessions.

Notes

¹ The total private employment statistics in this paragraph are from the Current Employment Statistics (CES) data published by the Bureau of Labor Statistics. (See "Current Employment Statistics – CES (National)," http://www.bls.gov/ces (visited Aug. 10, 2011).)

² The analysis in this article builds on and expands the earlier comparison of the BED statistics and the JOLTS in Zhi Boon, Charles M. Carson, R. Jason Faberman, and Randy E. Ilg, "Studying the labor market using BLS labor dynamics data," *Monthly Labor Review*, February 2008, pp. 3–16, http://www.bls.gov/opub/mlr/2008/02/art1full.pdf (visited July 21, 2011). Another comparison of job flows and worker flows can be found in Steven J. Davis, R. Jason Faberman, and John Haltiwanger, "Labor Market Flows in the Cross Section and Over Time," unpublished manuscript, March 20, 2011, http://www.carnegie-rochester.rochester. edu/April11-pdfs/Davis_Faberman_Haltiwanger_April_2011_CR_ Paper.pdf (visited Apr. 4, 2011).

³ For a more complete description of the BED data, including details on the source data and the longitudinal linking algorithm, see Timothy R. Pivetz, Michael A. Searson, and James R. Spletzer, "Measuring job and establishment flows with BLS longitudinal microdata," *Monthly Labor Review*, April 2001, pp. 13–20, http://www.bls.gov/opub/ mlr/2001/04/art2full.pdf (visited July 21, 2011); and James R. Spletzer, R. Jason Faberman, Akbar Sadeghi, David M. Talan, and Richard L. Clayton, "Business employment dynamics: new data on gross job gains and losses," *Monthly Labor Review*, April 2004, pp. 29–42, http://www. bls.gov/opub/mlr/2004/04/art3full.pdf (visited July 21, 2011).

⁴ The fourth-quarter, 2010, BED statistics were released on August 2, 2011. The most recent BED news release is titled "Business Employment Dynamics—Fourth Quarter 2010" (U.S. Bureau of Labor Statistics, Aug. 2, 2011), http://www.bls.gov/news.release/pdf/cewbd.pdf (visited Aug. 10, 2011).

⁵ To learn more about the JOLTS sample, definitions of variables, and survey forms, see "Job Openings and Labor Turnover Survey" (U.S. Bureau of Labor Statistics, updated monthly), **http://www.bls.gov/jlt** (visited July 25, 2011). The portion of the survey form presented in exhibit 1 is copied from "Job Openings and Labor Turnover Report" (U.S. Bureau of Labor Statistics, no date), **http://stats.bls.gov/jlt/ jltc1.pdf**.

⁶ The Bureau implemented the monthly alignment method with the release of January 2009 data, and all JOLTS historical series were revised to incorporate the new method. For further details regarding the improvements in methodology, see "Job Openings and Labor Turnover Survey: Improving JOLTS Methodology" (U.S Bureau of Labor Statistics, updated periodically), http://www.bls.gov/jlt/ methodologyimprovement.htm (visited July 25, 2011).

⁷ The June 2011 JOLTS statistics were released August 10, 2010. The most recent JOLTS news release is "Job Openings and Labor Turnover—June 2011" (U.S. Bureau of Labor Statistics, Aug. 10, 2011), http://www.bls.gov/news.release/pdf/jolts.pdf (visited Aug. 10, 2011).

⁸ The hires, separations, and net employment changes shown in charts 6 and 7 represent quarterly data and are much smoother than the trend lines based on monthly data. The small sample size of the JOLTS data causes some volatility in the monthly data, sometimes making it difficult to discern underlying economic trends.

⁹ The correlation coefficient quantifies how two data series move together through time. The correlation is +1 in the case of a perfect positive relationship, -1 in the case of a perfect negative relationship, and some value between -1 and +1 in all other cases, with 0 denoting no relationship between the two series. The closer the coefficient is to either -1 or +1, the stronger is the correlation between the variables.

Jobless rates in different types of labor market areas, 2000–2010

Before the 2007–2009 recession, metropolitan areas had unemployment rates that were 0.4 percentage point lower, on average, than micropolitan area rates, which in turn were slightly lower than those of small labor market areas; during the recession, rates increased and nearly equalized, and in 2010 the three types of area had about the same rate

Maggie C. Woodward

Maggie C. Woodward is an economist in the Office of Employment and Unemployment Statistics, Bureau of Labor Statistics. Email: woodward.maggie@ bls.gov abor market areas (LMAs) in the United States are classified into one of three types based upon the presence and size of urban cores in the areas. This article examines the rates of unemployment among the different types of areas over the past decade, which included two national recessions. The article also highlights areas with notable rates over the 2007–09 recession.¹

An LMA is "an economically integrated geographic area within which individuals can reside and find employment within a reasonable distance or can readily change employment without changing their place of residence."2 LMAs are nonoverlapping and geographically exhaust the Nation.³ Substate LMAs for which the Bureau of Labor Statistics (BLS) produces estimates can be broadly classified into two groups: Core-Based Statistical Areas (CBSAs), defined by the U.S. Office of Management and Budget (OMB),4 and small LMAs, defined by BLS.⁵ So called because of their concentration around urban cores, CBSAs are further classified by OMB into two types, based upon core population levels. Both types of CBSA consist of one or more whole counties6 and differ only in the size of their urban cores. The first type,

Metropolitan Statistical Areas, have cores with populations of at least 50,000. After Census 2000, OMB introduced a second type of CBSA, the Micropolitan Statistical Area, to encompass more of the United States. Micropolitan Statistical Areas have cores of at least 10,000, but fewer than 50,000, persons. Small LMAs make up the balance of the country and lack the large core populations that would classify them as CBSAs.

The vast majority of Americans live in the Nation's 372 metropolitan areas.⁷ As of 2009, the Census Bureau estimated that 84 percent of the U.S. population resided in these areas.⁸ In contrast, metropolitan areas account for only about 26 percent of the landmass of the United States. The Nation's 585 micropolitan areas contain about 10 percent of the U.S. population and occupy approximately 21 percent of the landmass. The remaining 6 percent of the population lives in small LMAs. More than half of the land area of the United States, 53 percent, is covered by the 1,362 small LMAs, about 95 percent of which consist of a single county each.

Findings and trends by type of LMA

Prior to the recession that began in December 2007, metropolitan areas as a group consistently had the lowest unemployment rates⁹

among the three geographic types. Jobless rates in micropolitan areas were 0.4 percentage point higher than those in metropolitan areas, on average, from 2000 to 2006. The average rates in small LMAs slightly exceeded those of micropolitan areas in every year over the same period. As unemployment rates in all three types of area rose in 2007–2010, their average rates nearly equalized. In 2010, metropolitan areas and small LMAs had the same average unemployment rate of 9.6 percent, nearly equal to the 9.7 percent averaged by micropolitan areas. (See chart 1.)

CBSAs by total population size

Although core size is rigorously defined by OMB, the delineation of a CBSA has no size limitation per se. As a result, the population of the largest micropolitan areas may exceed the population of the smallest metropolitan areas. Both metropolitan and micropolitan areas can be subdivided into large and small areas. On the basis of their populations at the time of the 2000 census, there are 237 "large" metropolitan areas, with populations in excess of the largest micropolitan area, Seaford, Delaware (population 156,638). The remaining 135 metropolitan areas are classified as "small" for this analysis. The population of the smallest metropolitan area, Palm Coast, Florida (population 49,832),¹⁰ provides the lower bound for the "large" micropolitan area category, into which 218 micropolitan areas fall. The "small" micropolitan area category consists of the remaining 367 areas. Classifying the areas in this way reveals a somewhat more complex pattern of differences in unemployment rates and in changes over the decade in the various types of area. (See chart 2.)

For micropolitan areas, unemployment rates, in the aggregate, were consistently higher in large areas than in small areas during times of increasing unemployment. Prior to and during the March–November 2001 recession, unemployment rates in large and small micropolitan areas increased at similar paces; however, large-area rates declined more rapidly during the recovery, resulting in the two rates converging in 2006. The rates in small and large micropolitan areas were little different from one another in 2007, but as the 2007–2009 recession deepened, large micropolitan area rates increased much more quickly than those of small micropolitan areas. The difference between the areas in both 2009 and 2010 was 0.6 percentage point.

Entering the 2001 recession, large metropolitan areas had rates slightly below those of small metropolitan areas, on average. However, rates in large metropolitan areas increased faster during the recession, eclipsing those in small ones at their respective high points. Rates in large metropolitan areas then declined faster than those in small metropolitan areas during the recovery. Rates in the two types of areas were roughly equal from 2005 to 2008. Rates for 2009–2010 show the average in large metropolitan areas again overtaking the average in small metropolitan areas.

Overall, the rates for small and large metropolitan areas varied in relation to one another, but varied more from either size of micropolitan area. The difference between metropolitan and micropolitan areas, regardless of their total population size, suggests that the core population size of an area may be a key influence on its unemployment rate. In both metropolitan and micropolitan areas, the smaller size class appears to show relatively more stability across the most recent business cycles.

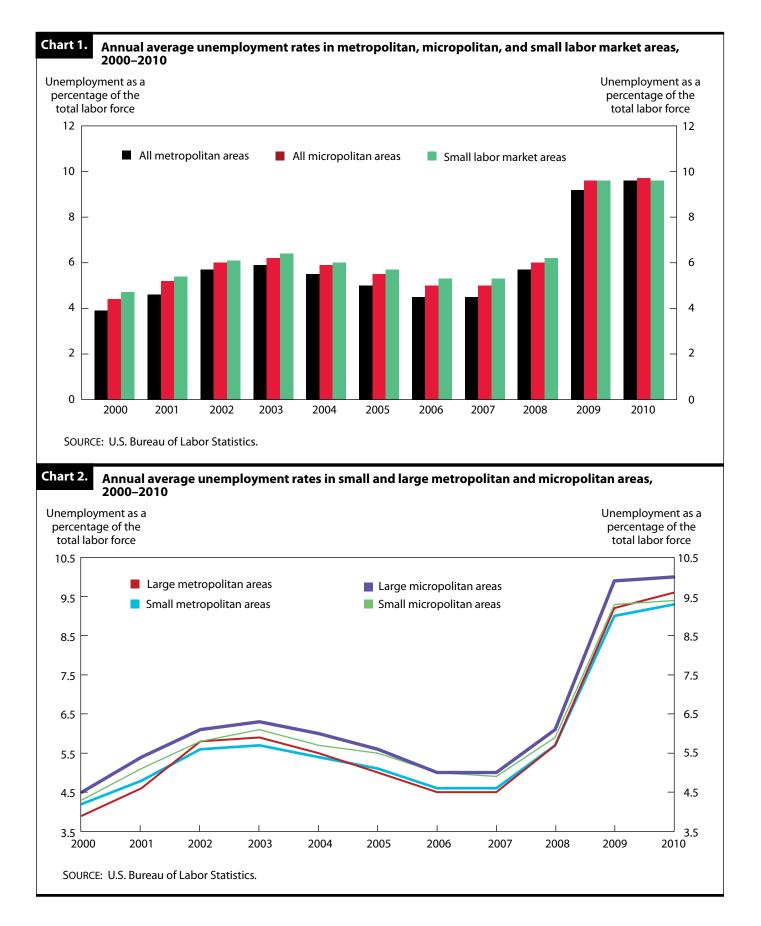

Individual areas in the 2007–2009 recession

The 2007–2009 recession had its onset in December 2007.¹¹ That year, the metropolitan area with the highest unemployment rate was El Centro, California. At 18.0 percent, the rate in this area was well above that of the next-highest rate, 13.8 percent, reported in neighboring Yuma, Arizona. These are agricultural areas with extreme summer weather and historically high unemployment rates. Following another substantial gap, Merced, California, had the third-highest rate, 10.0 percent, half a percentage point higher than Yuba City, California, at 9.5 percent. These areas continued to be among the metropolitan areas with the highest rates, 29.7 percent and 25.3 percent, respectively. The next-highest rates were 19.5 percent, in Yuba City, and 18.9 percent, in Merced.

Idaho Falls, Idaho, and Logan, Utah-Idaho, tied for the lowest rates among metropolitan areas in 2007, 2.1 percent each. Charlottesville, Virginia, had the next-lowest rate, 2.4 percent. In 2010, the lowest unemployment rate was 3.9 percent, reported in Bismarck, North Dakota. This rate was followed by 4.1 percent in Fargo, North Dakota-Minnesota, and 4.2 percent in Lincoln, Nebraska.

The highest unemployment rate in a micropolitan area in 2007 was 15.1 percent, reported in West Point, Mississippi. The next-highest rates were 11.8 percent, in Bennettsville, South Carolina, and 11.6 percent, in Eagle Pass, Texas. In 2010, Bennettsville and Fernley, Nevada, tied for the highest rate among micropolitan areas, 19.7 percent. The next-highest rate was 19.4 percent, recorded in West Point, Mississippi.

Williston, North Dakota, had the lowest unemployment rate in a micropolitan area in 2007, 1.9 percent. Gillette, Wyoming; Jackson, Wyoming-Idaho; and Los

Alamos, New Mexico, followed closely, with rates of 2.0 percent each. In 2010, Williston continued to report the lowest rate, 1.7 percent. The micropolitan areas with the next-lowest rates were Dickinson, North Dakota, and Pierre, South Dakota, at 2.6 percent and 3.3 percent, respectively.

From 2007 to 2010, the national unemployment rate increased by 5.0 percentage points. Over this period, the largest change in annual average unemployment rates among metropolitan areas was +11.7 percentage points, in El Centro. Las Vegas-Paradise, Nevada (+10.6 percentage points), and Yuba City (+10.0 points), had the nextlargest increases.

Bismarck, and Grand Forks, North Dakota-Minnesota,

reported the smallest increases from 2007 to 2010, +1.1 percentage points each. The two metropolitan areas with the next-smallest increases were Fargo (+1.3 percentage points) and Lincoln (+1.5 points). No metropolitan areas recorded drops in joblessness over the 2007–2010 time span.

Among micropolitan areas, the largest increase since 2007 was +13.2 percentage points, recorded in Fernley. Seven other micropolitan areas had rate increases of 10.0 percentage points or more. The smallest increases were reported in Dickinson (+0.1 percentage point) and in Minot, North Dakota (+0.5 point). Five other micropolitan areas had rate increases of 1.0 percentage point or less. Only one area, Williston, saw a rate decrease, -0.2 percentage point, from 2007 to 2010.

Notes

¹ The analysis that follows updates and expands the article "Micropolitan Statistical Areas: a few highlights," by George Helmer, which appeared in the April 2008 issue of the *Monthly Labor Review*.

² This definition comes from the Job Training and Partnership Act of 1982. The Bureau of Labor Statistics labor market area directory contains a comprehensive list of labor market areas. The 2011 directory, titled *Labor Market Areas, 2011*, is found at http://www.bls.gov/lau/lmadir.pdf (visited Aug. 2, 2011).

³ "with the exceptions of Kalawao County, Hawaii, and 18 isolated minor civil divisions...in New England" (*ibid.*, p. iii).

⁴ See 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas; Notice (Office of Management and Budget, June 28, 2010).

⁵ *Ibid.*; see especially Appendix II, "Criteria for Designating Small Labor Market Areas," p. 168.

⁶ Definitions of the two types of CBSA were introduced in the *Fed-eral Register*, Dec. 27, 2000. For the six New England States, the BLS Local Area Unemployment Statistics (LAUS) program produces data

for New England City and Town Areas (NECTAS), rather than county-based CBSAs.

 $^7\,$ The metropolitan areas are in all 50 States and the District of Columbia, but not in Puerto Rico, although CBSAs are defined for Puerto Rico.

⁸ See OMB Bulletin No. 10–02 (Office of Management and Budget, Dec. 1, 2009), http://www.whitehouse.gov/sites/default/files/ omb/assets/bulletins/b10-02.pdf (visited Aug. 2, 2011).

⁹ The comparison is based on the weighted mean unemployment rate with labor force as the weight—a rate that is mathematically equivalent to the aggregate rate for each type of area.

¹⁰ The 2000 census classified Palm Coast as a micropolitan area. Since then, it has become a metropolitan area, with a population greater than 50,000.

¹¹ The National Bureau of Economic Research declared June 2009 to be the end of the recession that began in December 2007, making the total duration of the downturn 18 months. However, the national unemployment rate continued to rise until late in 2009.

Balancing parenting time and employment

In 1967, approximately two-thirds of children in the United States had at least one parent at home full time, compared with only one-third of children in 2009. Does this shift indicate that parents are spending less time with their children? In "Time for children: Trends in the employment patterns of parents, 1967–2009," researchers Liana E. Fox, Wen-Jui Han, Christopher Ruhm, and Jane Waldfogel discuss trends in income, work hours, and parenting time over the past four decades (National Bureau of Economic Research, Working Paper 17135, June 2011).

The researchers analyzed March Current Population Survey (CPS) data from 1967 through 2009, University of Michigan Time Use in Economic and Social Accounts data for 1975, and BLS American Time Use Survey data for 2003 through 2008 to discover trends in the amount of time parents were spending at work and taking care of their children. They analyzed data for children living in single-parent and two-parent households by whether the child had all parents working full time and full year, at least one parent home part time or part year, or at least one parent who was home full time and full year.

The results of their analysis indicate a smaller proportion of children live in a household with a nonworking parent than in the past. The proportion of children in single-parent homes who had a nonworking parent decreased from 47 percent in 1967 to 27 percent in 2009, while the proportion of children living in two-parent homes who had a nonworking parent declined from 67 to 37 percent during the same period.

The amount of time parents spent with children, however, actually increased slightly. The time use data indicate that, in order to make more time to spend with their children, parents may have reallocated time to child care that would otherwise have been spent on other activities. The researchers hypothesized that some parents in two-parent households may be using a "tag team" approach to taking care of their children. The data also show, not surprisingly, that mothers without a job spent significantly more time in primary childcare than their employed counterparts. However, in 2003-2008, both employed parents and at-home parents spent more time with their children than did their counterparts in 1975. The researchers also found that parents in single-parent homes are more likely to be employed than are parents in households with two parents.

According to the study, younger children are more likely to have a nonworking parent, but the proportion of young children with a stayat-home parent has declined. In 2009, 40 percent of children under age 5 had at least one parent at home full time and full year, compared with 72 percent in 1969.

The authors also investigated another component of raising children: family income. In 2009 dollars, family income for two-parent homes increased 61 percent, from \$57,854 in 1967–1976 to \$93,348 in 2000– 2009. Over the same time period, one-parent family income increased from \$23,949 to \$29,157, an increase of only 22 percent. The researchers used this data to determine whether parents are being pushed or pulled into the labor force—that is, whether the parents find it necessary to work to avoid a decline in income, or whether they join the labor force because of the prospect of increased family income. The data imply that working single parents are more likely to have been pushed into the job market, whereas members of two-parent households tended to have been pulled into employment by attractive income opportunities.

Flows of capital

According to standard economic theory, there should be a net flow of savings from more developed countries to less developed countries because the marginal returns on capital are greater in the less developed nations. However, history has shown that capital does not always flow in that direction. Indeed, in the current global economy, it appears that capital is, on the whole, flowing "upstream" (that is, from less developed market economies to more developed market economies). For example, in the 1960s and 1970s, the U.S. current-account balance was not far from zero. However, the United States began to save less and less, and in 2006 the Nation's current-account deficit peaked at 6 percent of gross domestic product.

Economist Simona E. Cociuba sheds light on the international flow of capital in "Upstream Capital Flows: Why Emerging Markets Send Savings to Advanced Economies" (*Economic Letter*, Federal Reserve Bank of Dallas, May 2011). The article includes a basic description of how capital flows work:

Capital flows are streams of surplus savings channeled into

or out of a country. . . . Any savings not invested domestically is sent abroad in the form of goods and services. . . . A country with a current account surplus is a net lender. . . . In exchange for this capital outflow, the country increases its holdings of foreign assets by an equal amount.

International Monetary Fund data show that, most of the time, *private* capital does tend to flow to economies that are less developed. However, once nations' reserve assets are counted in the equation, it becomes clear that the overall flow of capital is from emerging market economies to wealthier economies and that this has been the case since 1999. Cociuba mentions three possible causes of capital flowing in this direction: (1) precautionary savings spurred by memories of the Asian financial crisis, (2) the shortage of safe assets in less developed economies, and (3) the tendency for some less developed countries to amass substantial foreign exchange reserves because of a desire to maintain competitive currencies and to grow their economies through exports. Given that there are large imbalances in the international flow of capital, there are talks of country-specific policy tools to help economies manage large inflows of capital and also of short-term capital controls that are not country specific; however, it is debatable which policies are better and how effective they are. □

A commentary on socioeconomic data

Interpreting Economic and Social Data: A Foundation of Descriptive Statistics. By Othmar W. Winkler, New York, NY, Springer Publishing, 2009, 265 pp., \$119.00/hardback.

Natural scientists apply the fundamental assumptions of statistics to experimental data to draw conclusions about natural phenomena. Social scientists use the same methodology with socioeconomic data to create dynamic models of human behavior. Othmar Winkler's Interpreting Economic and Social Data calls into question the tendency of social scientists to treat quantitative summary data as objective measurements, as occurs in the natural sciences. Winkler's observations on the subject are both thought-provoking and insightful.

Measurement in natural science is performed using uniform building blocks. By contrast, socioeconomic data emerges from "real-lifeobjects," which are the projecting agents of socioeconomic phenomena: households, firms, contracts, and sales, to name just a few examples. Relying primarily on the statistical survey, these objects are reduced to "statistical-counting-units" or "still-pictures...somewhat like a photographic snapshot-except that less detail is retained." Since these counting units are typically selfreported and the samples are usually subjectively chosen, it follows that they are hardly truly random. Furthermore, socioeconomic data can be influenced by a number of factors that are of little concern in natural science, such as the place and time

period the data are collected. As Winkler says, "the assumption that [socioeconomic] data are only random deviations from some 'true value' is a carryover from the thinking developed in the natural sciences," and "to analyze them with statistical methods based on inference and on the concept of random sampling is pseudoscience."

This indictment serves as the basis for much of the book. Winkler, a professor of business and economic statistics, is devoted to rehabilitating the proper treatment and interpretation of socioeconomic data. He laments that introductory statistical texts increasingly emphasize inferential statistics to the exclusion of descriptive statistics, the traditional domain of social scientists. This book aims to reverse the trend, and would serve nicely as a complement to the typical formula-driven undergraduate or early graduate-level text. Although the author strives to be straightforward, the book requires an understanding of concepts such as times series, frequency distributions, probability, and linear regression.

The early chapters focus on the structure and nature of socioeconomic data. Through aggregation, statistical-counting-units can be organized into feasible units of analysis; ratios allow these aggregates to be put in context with each other. After some conceptual framework, Winkler cautions on the "loss of meaning in aggregation;" in other words, that it is easy to lose sight of the phenomenon of interest as the level of aggregation grows. He also warns that specification is important because there is a temptation to produce ratios with entirely unrelated aggregates. An example of this would be producing a measure of

accidents per hours worked; a better ratio would be accidents per hours worked in a given industry, since many industries are not especially dangerous.

The middle, and largest, portions of the text focuses on longitudinal analysis. Winkler notes time series data seldom reveal universal economic laws and instead tend to be a product of the historical condition and landscape in which the data were recorded. Because of this fact, socioeconomic time series data utilized in forecasting models will eventually become obsolete as broader societal changes take place. Winkler cautions forecasters against the temptation to treat socioeconomic time series data as "random samples from some hypothetical timeless populations," which can lead to a sense of complacency as the number of observations increases. This word of warning seems pertinent, especially in the aftermath of the financial crisis of 2008.

Winkler's discussion of longitudinal analysis drifts into the realm of price statistics. He asserts that transactions of money for goods should be thought of as the real-life-object and the price paid as the statisticalcount-unit, which can vary widely depending on the place and time of purchase. Winkler suggests utilizing scanner data to produce a measure of average currency paid per transaction. This would negate the need to alter the basket of goods used in a price index as products enter or exit the market. Winkler also expresses concern that current measures of labor productivity focused on total hours of labor and output may fail to account for capital improvements over time.

Only late in the book does Winkler

approach cross-sectional analysis, beginning with a chapter on the interpretation of frequency distributions, central tendency, and dispersion. Turning to regression analysis, he notes that linear regression models originated in natural science are poorly suited to socioeconomic data, which is typically plagued by problems such as heteroskedasticity and low R-values. As a result, the line of best fit produced in regression equations is often fraught with misspecification issues and is likely to miss more complex relationships underlying the data. To remedy this, Winkler suggests using disaggregated data to the extent possible, and cautions against interpreting slope coefficients literally. A later chapter on the intersection of socioeconomic statistics and probability carries on

in this vein. The most common mistake is the application of statistical inference to populations or deliberately selected samples deemed "representative." Modern social scientists tend to "view every situation as a random process or a random experiment, regardless of whether randomization was involved." Winkler describes these misuses of inference as a trend, reinforced by statistics textbooks and journal editors. However, it seems likely the expanded use of mathematical statistics in social science is here to stay.

The book contains numerous diagrams to visually illustrate and reinforce the concepts described. The endnotes of each chapter contain detailed asides and citations should the reader be interested in pursuing any particular subject at length. Several chapters also contain appendices that cover topics that may require a refresher, or need additional space to explore concepts mathematically. There also are two short chapters focused on the use of statistics in accounting and geography.

The writing in this book is easy to digest, although in the later portions it can seem repetitive, likely because it is intended for use as a reference. Overall, this is a very practical book; it would serve an aspiring social scientist or an experienced practitioner well to work through its lessons.

—Thomas Luke Spreen Economist Bureau of Labor Statistics Division of Labor Force Statistics

This section of the *Review* presents the principal statistical series collected and calculated by the Bureau of Labor Statistics: series on labor force; employment; unemployment; labor compensation; consumer, producer, and international prices; productivity; international comparisons; and injury and illness statistics. In the notes that follow, the data in each group of tables are briefly described; key definitions are given; notes on the data are set forth; and sources of additional information are cited.

General notes

The following notes apply to several tables in this section:

Seasonal adjustment. Certain monthly and quarterly data are adjusted to eliminate the effect on the data of such factors as climatic conditions, industry production schedules, opening and closing of schools, holiday buying periods, and vacation practices, which might prevent short-term evaluation of the statistical series. Tables containing data that have been adjusted are identified as "seasonally adjusted." (All other data are not seasonally adjusted.) Seasonal effects are estimated on the basis of current and past experiences. When new seasonal factors are computed each year, revisions may affect seasonally adjusted data for several preceding years.

Seasonally adjusted data appear in tables 1–14, 17–21, 48, and 52. Seasonally adjusted labor force data in tables 1 and 4–9 and seasonally adjusted establishment survey data shown in tables 1, 12–14, and 17 usually are revised in the March issue of the *Review*. A brief explanation of the seasonal adjustment methodology appears in "Notes on the data."

Revisions in the productivity data in table 54 are usually introduced in the September issue. Seasonally adjusted indexes and percent changes from month-to-month and quarter-to-quarter are published for numerous Consumer and Producer Price Index series. However, seasonally adjusted indexes are not published for the U.S. average All-Items CPI. Only seasonally adjusted percent changes are available for this series.

Adjustments for price changes. Some data—such as the "real" earnings shown in table 14—are adjusted to eliminate the effect of changes in price. These adjustments are made by dividing current-dollar values by the Consumer Price Index or the appropriate component of the index, then multiplying by 100. For example, given a current hourly wage rate of \$3 and a current price index number of 150, where 1982 = 100, the hourly rate expressed in 1982 dollars is \$2 (\$3/150 x 100 = \$2). The \$2 (or any other resulting

values) are described as "real," "constant," or "1982" dollars.

Sources of information

Data that supplement the tables in this section are published by the Bureau in a variety of sources. Definitions of each series and notes on the data are contained in later sections of these Notes describing each set of data. For detailed descriptions of each data series, see *BLS Handbook of Methods*, Bulletin 2490. Users also may wish to consult *Major Programs of the Bureau of Labor Statistics*, Report 919. News releases provide the latest statistical information published by the Bureau; the major recurring releases are published according to the schedule appearing on the back cover of this issue.

More information about labor force, employment, and unemployment data and the household and establishment surveys underlying the data are available in the Bureau's monthly publication, *Employment* and Earnings. Historical unadjusted and seasonally adjusted data from the household survey are available on the Internet:

www.bls.gov/cps/

Historically comparable unadjusted and seasonally adjusted data from the establishment survey also are available on the Internet:

www.bls.gov/ces/

Additional information on labor force data for areas below the national level are provided in the BLS annual report, *Geographic Profile of Employment and Unemployment*.

For a comprehensive discussion of the Employment Cost Index, see *Employment Cost Indexes and Levels, 1975–95*, BLS Bulletin 2466. The most recent data from the Employee Benefits Survey appear in the following Bureau of Labor Statistics bulletins: *Employee Benefits in Medium and Large Firms; Employee Benefits in Small Private Establishments;* and *Employee Benefits in State and Local Governments.*

More detailed data on consumer and producer prices are published in the monthly periodicals, *The CPI Detailed Report* and *Producer Price Indexes*. For an overview of the 1998 revision of the CPI, see the December 1996 issue of the *Monthly Labor Review*. Additional data on international prices appear in monthly news releases.

Listings of industries for which productivity indexes are available may be found on the Internet:

www.bls.gov/lpc/

For additional information on international comparisons data, see *International Comparisons of Unemployment*, Bulletin

1979.

Detailed data on the occupational injury and illness series are published in *Occupational Injuries and Illnesses in the United States, by Industry*, a BLS annual bulletin.

Finally, the *Monthly Labor Review* carries analytical articles on annual and longer term developments in labor force, employment, and unemployment; employee compensation and collective bargaining; prices; productivity; international comparisons; and injury and illness data.

Symbols

n.e.c. = not elsewhere classified.

- n.e.s. = not elsewhere specified.
 - p = preliminary. To increase the timeliness of some series, preliminary figures are issued based on representative but incomplete returns.
 - revised. Generally, this revision reflects the availability of later data, but also may reflect other adjustments.

Comparative Indicators

(Tables 1-3)

Comparative indicators tables provide an overview and comparison of major BLS statistical series. Consequently, although many of the included series are available monthly, all measures in these comparative tables are presented quarterly and annually.

Labor market indicators include employment measures from two major surveys and information on rates of change in compensation provided by the Employment Cost Index (ECI) program. The labor force participation rate, the employment-population ratio, and unemployment rates for major demographic groups based on the Current Population ("household") Survey are presented, while measures of employment and average weekly hours by major industry sector are given using nonfarm payroll data. The Employment Cost Index (compensation), by major sector and by bargaining status, is chosen from a variety of BLS compensation and wage measures because it provides a comprehensive measure of employer costs for hiring labor, not just outlays for wages, and it is not affected by employment shifts among occupations and industries.

Data on changes in compensation, prices, and productivity are presented in table 2. Measures of rates of change of compensation and wages from the Employment Cost Index program are provided for all civilian nonfarm workers (excluding Federal and household workers) and for all private nonfarm workers. Measures of changes in consumer prices for all urban consumers; producer prices by stage of processing; overall prices by stage of processing; and overall export and import price indexes are given. Measures of productivity (output per hour of all persons) are provided for major sectors.

Alternative measures of wage and compensation rates of change, which reflect the overall trend in labor costs, are summarized in table 3. Differences in concepts and scope, related to the specific purposes of the series, contribute to the variation in changes among the individual measures.

Notes on the data

Definitions of each series and notes on the data are contained in later sections of these notes describing each set of data.

Employment and Unemployment Data

(Tables 1; 4-29)

Household survey data

Description of the series

Employment data in this section are obtained from the Current Population Survey, a program of personal interviews conducted monthly by the Bureau of the Census for the Bureau of Labor Statistics. The sample consists of about 60,000 households selected to represent the U.S. population 16 years of age and older. Households are interviewed on a rotating basis, so that three-fourths of the sample is the same for any 2 consecutive months.

Definitions

Employed persons include (1) all those who worked for pay any time during the week which includes the 12th day of the month or who worked unpaid for 15 hours or more in a family-operated enterprise and (2) those who were temporarily absent from their regular jobs because of illness, vacation, industrial dispute, or similar reasons. A person working at more than one job is counted only in the job at which he or she worked the greatest number of hours.

Unemployed persons are those who did not work during the survey week, but were available for work except for temporary illness and had looked for jobs within the preceding 4 weeks. Persons who did not look for work because they were on layoff are also counted among the unemployed. **The unemployment rate** represents the number unemployed as a percent of the civilian labor force.

The civilian labor force consists of all employed or unemployed persons in the civilian noninstitutional population. Persons not in the labor force are those not classified as employed or unemployed. This group includes discouraged workers, defined as persons who want and are available for a job and who have looked for work sometime in the past 12 months (or since the end of their last job if they held one within the past 12 months), but are not currently looking, because they believe there are no jobs available or there are none for which they would qualify. The civilian noninstitutional population comprises all persons 16 years of age and older who are not inmates of penal or mental institutions, sanitariums, or homes for the aged, infirm, or needy. The civilian labor force partici**pation** rate is the proportion of the civilian noninstitutional population that is in the labor force. The employment-population ratio is employment as a percent of the civilian noninstitutional population.

Notes on the data

From time to time, and especially after a decennial census, adjustments are made in the Current Population Survey figures to correct for estimating errors during the intercensal years. These adjustments affect the comparability of historical data. A description of these adjustments and their effect on the various data series appears in the Explanatory Notes of *Employment and Earnings*. For a discussion of changes introduced in January 2003, see "Revisions to the Current Population Survey Effective in January 2003" in the February 2003 issue of *Employment and Earnings* (available on the BLS Web site at **www.bls.gov/cps/rvcps03.pdf**).

Effective in January 2003, BLS began using the X-12 ARIMA seasonal adjustment program to seasonally adjust national labor force data. This program replaced the X-11 ARIMA program which had been used since January 1980. See "Revision of Seasonally Adjusted Labor Force Series in 2003," in the February 2003 issue of *Employment and Earnings* (available on the BLS Web site at **www.bls.gov/cps/cpsrs.pdf**) for a discussion of the introduction of the use of X-12 ARIMA for seasonal adjustment of the labor force data and the effects that it had on the data.

At the beginning of each calendar year, historical seasonally adjusted data usually are revised, and projected seasonal adjustment factors are calculated for use during the January–June period. The historical seasonally adjusted data usually are revised for only the most recent 5 years. In July, new seasonal adjustment factors, which incorporate the experience through June, are produced for the July–December period, but no revisions are made in the historical data.

FOR ADDITIONAL INFORMATION on national household survey data, contact the Division of Labor Force Statistics: (202) 691–6378.

Establishment survey data

Description of the series

Employment, hours, and earnings data in this section are compiled from payroll records reported monthly on a voluntary basis to the Bureau of Labor Statistics and its cooperating State agencies by about 160,000 businesses and government agencies, which represent approximately 400,000 individual worksites and represent all industries except agriculture. The active CES sample covers approximately one-third of all nonfarm payroll workers. Industries are classified in accordance with the 2007 North American Industry Classification System. In most industries, the sampling probabilities are based on the size of the establishment; most large establishments are therefore in the sample. (An establishment is not necessarily a firm; it may be a branch plant, for example, or warehouse.) Self-employed persons and others not on a regular civilian payroll are outside the scope of the survey because they are excluded from establishment records. This largely accounts for the difference in employment figures between the household and establishment surveys.

Definitions

An **establishment** is an economic unit which produces goods or services (such as a factory or store) at a single location and is engaged in one type of economic activity.

Employed persons are all persons who received pay (including holiday and sick pay) for any part of the payroll period including the 12th day of the month. Persons holding more than one job (about 5 percent of all persons in the labor force) are counted in each establishment which reports them.

Production workers in the goods-producing industries cover employees, up through the level of working supervisors, who engage directly in the manufacture or construction of the establishment's product. In private service-providing industries, data are collected for nonsupervisory workers, which include most employees except those in executive, managerial, and supervisory positions. Those workers mentioned in tables 11–16 include production workers in manufacturing and natural resources and mining; construction workers in construction; and nonsupervisory workers in all private service-providing industries. Production and nonsupervisory workers account for about four-fifths of the total employment on private nonagricultural payrolls.

Earnings are the payments production or nonsupervisory workers receive during the survey period, including premium pay for overtime or late-shift work but excluding irregular bonuses and other special payments. **Real earnings** are earnings adjusted to reflect the effects of changes in consumer prices. The deflator for this series is derived from the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W).

Hours represent the average weekly hours of production or nonsupervisory workers for which pay was received, and are different from standard or scheduled hours. Overtime hours represent the portion of average weekly hours which was in excess of regular hours and for which overtime premiums were paid.

The Diffusion Index represents the percent of industries in which employment was rising over the indicated period, plus one-half of the industries with unchanged employment; 50 percent indicates an equal balance between industries with increasing and decreasing employment. In line with Bureau practice, data for the 1-, 3-, and 6month spans are seasonally adjusted, while those for the 12-month span are unadjusted. Table 17 provides an index on private nonfarm employment based on 278 industries, and a manufacturing index based on 84 industries. These indexes are useful for measuring the dispersion of economic gains or losses and are also economic indicators.

Notes on the data

With the release of data for January 2010, the CES program introduced its annual revision of national estimates of employment, hours, and earnings from the monthly survey of nonfarm establishments. Each year, the CES survey realigns its sample-based estimates to incorporate universe counts of employment—a process known as benchmarking. Comprehensive counts of employment, or benchmarks, are derived primarily from unemployment insurance (UI) tax reports that nearly all employers are required to file with State Workforce Agencies. With the release in June 2003, CES completed the transition from its original quota sample design to a probability-based sample design. The industry-coding update included reconstruction of historical estimates in order to preserve time series for data users. Normally 5 years of seasonally adjusted data are revised with each benchmark revision. However, with this release, the entire new time series history for all CES data series were re-seasonally adjusted due to the NAICS conversion, which resulted in the revision of all CES time series.

Also in June 2003, the CES program introduced concurrent seasonal adjustment for the national establishment data. Under this methodology, the first preliminary estimates for the current reference month and the revised estimates for the 2 prior months will be updated with concurrent factors with each new release of data. Concurrent seasonal adjustment incorporates all available data, including first preliminary estimates for the most current month, in the adjustment process. For additional information on all of the changes introduced in June 2003, see the June 2003 issue of Employment and Earnings and "Recent changes in the national Current Employment Statistics survey," Monthly Labor Review, June 2003, pp. 3-13.

Revisions in State data (table 11) occurred with the publication of January 2003 data. For information on the revisions for the State data, see the March and May 2003 issues of *Employment and Earnings*, and "Recent changes in the State and Metropolitan Area CES survey," *Monthly Labor Review*, June 2003, pp. 14–19.

Beginning in June 1996, the BLS uses the X-12-ARIMA methodology to seasonally adjust establishment survey data. This procedure, developed by the Bureau of the Census, controls for the effect of varying survey intervals (also known as the 4- versus 5-week effect), thereby providing improved measurement of over-the-month changes and underlying economic trends. Revisions of data, usually for the most recent 5-year period, are made once a year coincident with the benchmark revisions.

In the establishment survey, estimates for the most recent 2 months are based on incomplete returns and are published as preliminary in the tables (12–17 in the *Review*). When all returns have been received, the estimates are revised and published as "final" (prior to any benchmark revisions) in the third month of their appearance. Thus, December data are published as preliminary in January and February and as final in March. For the same reasons, quarterly establishment data (table 1) are preliminary for the first 2 months of publication and final in the third month. Fourth-quarter data are published as preliminary in January and February and as final in March.

FOR ADDITIONAL INFORMATION on establishment survey data, contact the Division of Current Employment Statistics: (202) 691–6555.

Unemployment data by State

Description of the series

Data presented in this section are obtained from the Local Area Unemployment Statistics (LAUS) program, which is conducted in cooperation with State employment security agencies.

Monthly estimates of the labor force, employment, and unemployment for States and sub-State areas are a key indicator of local economic conditions, and form the basis for determining the eligibility of an area for benefits under Federal economic assistance programs such as the Job Training Partnership Act. Seasonally adjusted unemployment rates are presented in table 10. Insofar as possible, the concepts and definitions underlying these data are those used in the national estimates obtained from the CPS.

Notes on the data

Data refer to State of residence. Monthly data for all States and the District of Columbia are derived using standardized procedures established by BLS. Once a year, estimates are revised to new population controls, usually with publication of January estimates, and benchmarked to annual average CPS levels.

FOR ADDITIONAL INFORMATION on data in this series, call (202) 691–6392 (table 10) or (202) 691–6559 (table 11).

Quarterly Census of Employment and Wages

Description of the series

Employment, wage, and establishment data in this section are derived from the quarterly tax reports submitted to State employment security agencies by private and State and local government employers subject to State unemployment insurance (UI) laws and from Federal, agencies subject to the Unemployment Compensation for Federal Employees (UCFE) program. Each quarter, State agencies edit and process the data and send the information to the Bureau of Labor Statistics.

The Quarterly Census of Employment and Wages (QCEW) data, also referred as ES-202 data, are the most complete enumeration of employment and wage information by industry at the national, State, metropolitan area, and county levels. They have broad economic significance in evaluating labor market trends and major industry developments.

Definitions

In general, the Quarterly Census of Employment and Wages monthly employment data represent the number of covered workers who worked during, or received pay for, the pay period that included the 12th day of the month. Covered private industry employment includes most corporate officials, executives, supervisory personnel, professionals, clerical workers, wage earners, piece workers, and part-time workers. It excludes proprietors, the unincorporated self-employed, unpaid family members, and certain farm and domestic workers. Certain types of nonprofit employers, such as religious organizations, are given a choice of coverage or exclusion in a number of States. Workers in these organizations are, therefore, reported to a limited degree.

Persons on paid sick leave, paid holiday, paid vacation, and the like, are included. Persons on the payroll of more than one firm during the period are counted by each UI-subject employer if they meet the employment definition noted earlier. The employment count excludes workers who earned no wages during the entire applicable pay period because of work stoppages, temporary layoffs, illness, or unpaid vacations.

Federal employment data are based on reports of monthly employment and quarterly wages submitted each quarter to State agencies for all Federal installations with employees covered by the Unemployment Compensation for Federal Employees (UCFE) program, except for certain national security agencies, which are omitted for security reasons. Employment for all Federal agencies for any given month is based on the number of persons who worked during or received pay for the pay period that included the 12th of the month.

An **establishment** is an economic unit, such as a farm, mine, factory, or store, that produces goods or provides services. It is typically at a single physical location and engaged in one, or predominantly one, type of economic activity for which a single industrial classification may be applied. Occasionally, a single physical location encompasses two or more distinct and significant activities. Each activity should be reported as a separate establishment if separate records are kept and the various activities are classified under different NAICS industries.

Most employers have only one establishment; thus, the establishment is the predominant reporting unit or statistical entity for reporting employment and wages data. Most employers, including State and local governments who operate more than one establishment in a State, file a Multiple Worksite Report each quarter, in addition to their quarterly UI report. The Multiple Worksite Report is used to collect separate employment and wage data for each of the employer's establishments, which are not detailed on the UI report. Some very small multi-establishment employers do not file a Multiple Worksite Report. When the total employment in an employer's secondary establishments (all establishments other than the largest) is 10 or fewer, the employer generally will file a consolidated report for all establishments. Also, some employers either cannot or will not report at the establishment level and thus aggregate establishments into one consolidated unit, or possibly several units, though not at the establishment level.

For the Federal Government, the reporting unit is the **installation**: a single location at which a department, agency, or other government body has civilian employees. Federal agencies follow slightly different criteria than do private employers when breaking down their reports by installation. They are permitted to combine as a single statewide unit: 1) all installations with 10 or fewer workers, and 2) all installations that have a combined total in the State of fewer than 50 workers. Also, when there are fewer than 25 workers in all secondary installations in a State, the secondary installations may be combined and reported with the major installation. Last, if a Federal agency has fewer than five employees in a State, the agency headquarters office (regional office, district office) serving each State may consolidate the employment and wages data for that State with the data reported to the State in which the headquarters is located. As a result of these reporting rules, the number of reporting units is always larger than the number of employers (or government agencies) but smaller than the number of actual establishments (or installations).

Data reported for the first quarter are tabulated into **size** categories ranging from worksites of very small size to those with 1,000 employees or more. The size category is determined by the establishment's March employment level. It is important to note that each establishment of a multi-establishment firm is tabulated separately into the appropriate size category. The total employment level of the reporting multi-establishment firm is not used in the size tabulation.

Covered employers in most States report total **wages** paid during the calendar quarter, regardless of when the services were performed. A few State laws, however, specify that wages be reported for, or based on the period during which services are performed rather than the period during which compensation is paid. Under most State laws or regulations, wages include bonuses, stock options, the cash value of meals and lodging, tips and other gratuities, and, in some States, employer contributions to certain deferred compensation plans such as 401(k) plans.

Covered employer contributions for old-age, survivors, and disability insurance (OASDI), health insurance, unemployment insurance, workers' compensation, and private pension and welfare funds are not reported as wages. Employee contributions for the same purposes, however, as well as money withheld for income taxes, union dues, and so forth, are reported even though they are deducted from the worker's gross pay.

Wages of covered Federal workers represent the gross amount of all payrolls for all pay periods ending within the quarter. This includes cash allowances, the cash equivalent of any type of remuneration, severance pay, withholding taxes, and retirement deductions. Federal employee remuneration generally covers the same types of services as for workers in private industry.

Average annual wage per employee for any given industry are computed by dividing total annual wages by annual average employment. A further division by 52 yields average weekly wages per employee. Annual pay data only approximate annual earnings because an individual may not be employed by the same employer all year or may work for more than one employer at a time.

Average weekly or annual wage is affected by the ratio of full-time to part-time workers as well as the number of individuals in high-paying and low-paying occupations. When average pay levels between States and industries are compared, these factors should be taken into consideration. For example, industries characterized by high proportions of part-time workers will show average wage levels appreciably less than the weekly pay levels of regular full-time employees in these industries. The opposite effect characterizes industries with low proportions of part-time workers, or industries that typically schedule heavy weekend and overtime work. Average wage data also may be influenced by work stoppages, labor turnover rates, retroactive payments, seasonal factors, bonus payments, and so on.

Notes on the data

Beginning with the release of data for 2007, publications presenting data from the Covered Employment and Wages program have switched to the 2007 version of the North American Industry Classification System (NAICS) as the basis for the assignment and tabulation of economic data by industry. NAICS is the product of a cooperative effort on the part of the statistical agencies of the United States, Canada, and Mexico. Due to difference in NAICS and Standard Industrial Classification (SIC) structures, industry data for 2001 is not comparable to the SIC-based data for earlier years.

Effective January 2001, the program began assigning Indian Tribal Councils and related establishments to local government ownership. This BLS action was in response to a change in Federal law dealing with the way Indian Tribes are treated under the Federal Unemployment Tax Act. This law requires federally recognized Indian Tribes to be treated similarly to State and local governments. In the past, the Covered Employment and Wage (CEW) program coded Indian Tribal Councils and related establishments in the private sector. As a result of the new law, CEW data reflects significant shifts in employment and wages between the private sector and local government from 2000 to 2001. Data also reflect industry changes. Those accounts previously assigned to civic and social organizations were assigned to tribal governments. There were no required industry changes for related establishments owned by these Tribal Councils. These tribal business establishments continued to be coded according to the economic activity of that entity.

To insure the highest possible quality of data, State employment security agencies verify with employers and update, if necessary, the industry, location, and ownership classification of all establishments on a 3-year cycle. Changes in establishment classification codes resulting from the verification process are introduced with the data reported for the first quarter of the year. Changes resulting from improved employer reporting also are introduced in the first quarter. For these reasons, some data, especially at more detailed geographic levels, may not be strictly comparable with earlier years.

County definitions are assigned according to Federal Information Processing Standards Publications as issued by the National Institute of Standards and Technology. Areas shown as counties include those designated as independent cities in some jurisdictions and, in Alaska, those areas designated by the Census Bureau where counties have not been created. County data also are presented for the New England States for comparative purposes, even though townships are the more common designation used in New England (and New Jersey). The Office of Management and Budget (OMB) defines metropolitan areas for use in Federal statistical activities and updates these definitions as needed. Data in this table use metropolitan area criteria established by OMB in definitions issued June 30, 1999 (OMB Bulletin No. 99-04). These definitions reflect information obtained from the 1990 Decennial Census and the 1998 U.S. Census Bureau population estimate. A complete list of metropolitan area definitions is available from the National Technical Information Service (NTIS), Document Sales, 5205 Port Royal Road, Springfield, Va. 22161, telephone 1-800-553-6847.

OMB defines metropolitan areas in terms of entire counties, except in the six New England States where they are defined in terms of cities and towns. New England data in this table, however, are based on a county concept defined by OMB as New England County Metropolitan Areas (NECMA) because county-level data are the most detailed available from the Quarterly Census of Employment and Wages. The NECMA is a county-based alternative to the city- and town-based metropolitan areas in New England. The NECMA for a Metropolitan Statistical Area (MSA) include: (1) the county containing the first-named city in that MSA title (this county may include the first-named cities of other MSA, and (2) each additional county having at least half its population in the MSA in which first-named cities are in the county identified in step 1. The NECMA is officially defined areas that are meant to be used by statistical programs that cannot use the regular metropolitan area definitions in New England.

FOR ADDITIONAL INFORMATION on the covered employment and wage data, contact the Division of Administrative Statistics and Labor Turnover at (202) 691–6567.

Job Openings and Labor Turnover Survey

Description of the series

Data for the Job Openings and Labor Turnover Survey (JOLTS) are collected and compiled from a sample of 16,000 business establishments. Each month, data are collected for total employment, job openings, hires, quits, layoffs and discharges, and other separations. The JOLTS program covers all private nonfarm establishments such as factories, offices, and stores, as well as Federal, State, and local government entities in the 50 States and the District of Columbia. The JOLTS sample design is a random sample drawn from a universe of more than eight million establishments compiled as part of the operations of the Quarterly Census of Employment and Wages, or QCEW, program. This program includes all employers subject to State unemployment insurance (UI) laws and Federal agencies subject to Unemployment Compensation for Federal Employees (UCFE).

The sampling frame is stratified by ownership, region, industry sector, and size class. Large firms fall into the sample with virtual certainty. JOLTS total employment estimates are controlled to the employment estimates of the Current Employment Statistics (CES) survey. A ratio of CES to JOLTS employment is used to adjust the levels for all other JOLTS data elements. Rates then are computed from the adjusted levels.

The monthly JOLTS data series begin with December 2000. Not seasonally adjusted data on job openings, hires, total separations, quits, layoffs and discharges, and other separations levels and rates are available for the total nonfarm sector, 16 private industry divisions and 2 government divisions based on the North American Industry Classification System (NAICS), and four geographic regions. Seasonally adjusted data on job openings, hires, total separations, and quits levels and rates are available for the total nonfarm sector, selected industry sectors, and four geographic regions.

Definitions

Establishments submit job openings information for the last business day of the reference month. A job opening requires that (1) a specific position exists and there is work available for that position; and (2) work could start within 30 days regardless of whether a suitable candidate is found; and (3) the employer is actively recruiting from outside the establishment to fill the position. Included are full-time, part-time, permanent, short-term, and seasonal openings. Active recruiting means that the establishment is taking steps to fill a position by advertising in newspapers or on the Internet, posting help-wanted signs, accepting applications, or using other similar methods.

Jobs to be filled only by internal transfers, promotions, demotions, or recall from layoffs are excluded. Also excluded are jobs with start dates more than 30 days in the future, jobs for which employees have been hired but have not yet reported for work, and jobs to be filled by employees of temporary help agencies, employee leasing companies, outside contractors, or consultants. The job openings rate is computed by dividing the number of job openings by the sum of employment and job openings, and multiplying that quotient

by 100.

Hires are the total number of additions to the payroll occurring at any time during the reference month, including both new and rehired employees and full-time and parttime, permanent, short-term and seasonal employees, employees recalled to the location after a layoff lasting more than 7 days, on-call or intermittent employees who returned to work after having been formally separated, and transfers from other locations. The hires count does not include transfers or promotions within the reporting site, employees returning from strike, employees of temporary help agencies or employee leasing companies, outside contractors, or consultants. The hires rate is computed by dividing the number of hires by employment, and multiplying that quotient by 100.

Separations are the total number of terminations of employment occurring at any time during the reference month, and are reported by type of separation-quits, layoffs and discharges, and other separations. Quits are voluntary separations by employees (except for retirements, which are reported as other separations). Layoffs and discharges are involuntary separations initiated by the employer and include layoffs with no intent to rehire, formal layoffs lasting or expected to last more than 7 days, discharges resulting from mergers, downsizing, or closings, firings or other discharges for cause, terminations of permanent or short-term employees, and terminations of seasonal employees. Other separations include retirements, transfers to other locations, deaths, and separations due to disability. Separations do not include transfers within the same location or employees on strike.

The separations rate is computed by dividing the number of separations by employment, and multiplying that quotient by 100. The quits, layoffs and discharges, and other separations rates are computed similarly, dividing the number by employment and multiplying by 100.

Notes on the data

The JOLTS data series on job openings, hires, and separations are relatively new. The full sample is divided into panels, with one panel enrolled each month. A full complement of panels for the original data series based on the 1987 Standard Industrial Classification (SIC) system was not completely enrolled in the survey until January 2002. The supplemental panels of establishments needed to create NAICS estimates were not completely enrolled until May 2003. The data collected up until those points are from less than a full sample. Therefore, estimates from earlier months should be used with caution, as fewer sampled units were reporting data at that time.

In March 2002, BLS procedures for collecting hires and separations data were revised to address possible underreporting. As a result, JOLTS hires and separations estimates for months prior to March 2002 may not be comparable with estimates for March 2002 and later.

The Federal Government reorganization that involved transferring approximately 180,000 employees to the new Department of Homeland Security is not reflected in the JOLTS hires and separations estimates for the Federal Government. The Office of Personnel Management's record shows these transfers were completed in March 2003. The inclusion of transfers in the JOLTS definitions of hires and separations is intended to cover ongoing movements of workers between establishments. The Department of Homeland Security reorganization was a massive one-time event, and the inclusion of these intergovernmental transfers would distort the Federal Government time series.

Data users should note that seasonal adjustment of the JOLTS series is conducted with fewer data observations than is customary. The historical data, therefore, may be subject to larger than normal revisions. Because the seasonal patterns in economic data series typically emerge over time, the standard use of moving averages as seasonal filters to capture these effects requires longer series than are currently available. As a result, the stable seasonal filter option is used in the seasonal adjustment of the JOLTS data. When calculating seasonal factors, this filter takes an average for each calendar month after detrending the series. The stable seasonal filter assumes that the seasonal factors are fixed; a necessary assumption until sufficient data are available. When the stable seasonal filter is no longer needed, other program features also may be introduced, such as outlier adjustment and extended diagnostic testing. Additionally, it is expected that more series, such as layoffs and discharges and additional industries, may be seasonally adjusted when more data are available.

JOLTS hires and separations estimates cannot be used to exactly explain net changes in payroll employment. Some reasons why it is problematic to compare changes in payroll employment with JOLTS hires and separations, especially on a monthly basis, are: (1) the reference period for payroll employment is the pay period including the 12th of the month, while the reference period for hires and separations is the calendar month; and (2) payroll employment can vary from month to month simply because part-time and oncall workers may not always work during the pay period that includes the 12th of the month. Additionally, research has found that some reporters systematically underreport separations relative to hires due to a number of factors, including the nature of their payroll systems and practices. The shortfall appears to be about 2 percent or less over a 12-month period.

FOR ADDITIONAL INFORMATION on the Job Openings and Labor Turnover Survey, contact the Division of Administrative Statistics and Labor Turnover at (202) 961–5870.

Compensation and Wage Data

(Tables 1-3; 30-37)

The National Compensation Survey (NCS) produces a variety of compensation data. These include: The Employment Cost Index (ECI) and NCS benefit measures of the incidence and provisions of selected employee benefit plans. Selected samples of these measures appear in the following tables. NCS also compiles data on occupational wages and the Employer Costs for Employee Compensation (ECEC).

Employment Cost Index

Description of the series

The **Employment Cost Index** (ECI) is a quarterly measure of the rate of change in compensation per hour worked and includes wages, salaries, and employer costs of employee benefits. It is a Laspeyres Index that uses fixed employment weights to measure change in labor costs free from the influence of employment shifts among occupations and industries.

The ECI provides data for the civilian economy, which includes the total private nonfarm economy excluding private households, and the public sector excluding the Federal government. Data are collected each quarter for the pay period including the 12th day of March, June, September, and December.

Sample establishments are classified by industry categories based on the 2007 North American Classification System (NAICS). Within a sample establishment, specific job categories are selected and classified into about 800 occupations according to the 2000 Standard Occupational Classification (SOC) System. Individual occupations are combined to represent one of ten intermediate aggregations, such as professional and related occupations, or one of five higher level aggregations, such as management, professional, and related occupations.

Fixed employment weights are used each quarter to calculate the most aggregate series-civilian, private, and State and local government. These fixed weights are also used to derive all of the industry and occupational series indexes. Beginning with the March 2006 estimates, 2002 fixed employment weights from the Bureau's Occupational Employment Statistics survey were introduced. From March 1995 to December 2005, 1990 employment counts were used. These fixed weights ensure that changes in these indexes reflect only changes in compensation, not employment shifts among industries or occupations with different levels of wages and compensation. For the series based on bargaining status, census region and division, and metropolitan area status, fixed employment data are not available. The employment weights are reallocated within these series each quarter based on the current ECI sample. The indexes for these series, consequently, are not strictly comparable with those for aggregate, occupational, and industry series.

Definitions

Total compensation costs include wages, salaries, and the employer's costs for employee benefits.

Wages and salaries consist of earnings before payroll deductions, including production bonuses, incentive earnings, commissions, and cost-of-living adjustments.

Benefits include the cost to employers for paid leave, supplemental pay (including nonproduction bonuses), insurance, retirement and savings plans, and legally required benefits (such as Social Security, workers' compensation, and unemployment insurance).

Excluded from wages and salaries and employee benefits are such items as paymentin-kind, free room and board, and tips.

Notes on the data

The ECI data in these tables reflect the con-version to the 2002 North American Industry Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. ECI series based on NAICS and SOC became the official BLS estimates starting in March 2006.

The ECI for changes in wages and salaries in the private nonfarm economy was published beginning in 1975. Changes in total compensation cost—wages and salaries and benefits combined—were published beginning in 1980. The series of changes in wages and salaries and for total compensation in the State and local government sector and in the civilian nonfarm economy (excluding Federal employees) were published beginning in 1981. Historical indexes (December 2005=100) are available on the Internet: www.bls.gov/ect/

ADDITIONAL INFORMATION on the Employment Cost Index is available at **www. bls.gov/ncs/ect/home.htm** or by telephone at (202) 691–6199.

National Compensation Survey Benefit Measures

Description of the series

NCS benefit measures of employee benefits are published in two separate reports. The annual summary provides data on the incidence of (access to and participation in) selected benefits and provisions of paid holidays and vacations, life insurance plans, and other selected benefit programs. Data on percentages of establishments offering major employee benefits, and on the employer and employee shares of contributions to medical care premiums also are presented. Selected benefit data appear in the following tables. A second publication, published later, contains more detailed information about health and retirement plans.

Definitions

Employer-provided benefits are benefits that are financed either wholly or partly by the employer. They may be sponsored by a union or other third party, as long as there is some employer financing. However, some benefits that are fully paid for by the employee also are included. For example, long-term care insurance paid entirely by the employee are included because the guarantee of insurability and availability at group premium rates are considered a benefit.

Employees are considered as having **ac**cess to a benefit plan if it is available for their use. For example, if an employee is permitted to participate in a medical care plan offered by the employer, but the employee declines to do so, he or she is placed in the category with those having access to medical care.

Employees in contributory plans are considered as **participating** in an insurance or retirement plan if they have paid required contributions and fulfilled any applicable service requirement. Employees in noncontributory plans are counted as participating regardless of whether they have fulfilled the service requirements.

Defined benefit pension plans use predetermined formulas to calculate a retirement benefit (if any), and obligate the employer to provide those benefits. Benefits are generally based on salary, years of service, or both.

Defined contribution plans generally specify the level of employer and employee contributions to a plan, but not the formula for determining eventual benefits. Instead, individual accounts are set up for participants, and benefits are based on amounts credited to these accounts.

Tax-deferred savings plans are a type of defined contribution plan that allow participants to contribute a portion of their salary to an employer-sponsored plan and defer income taxes until withdrawal.

Flexible benefit plans allow employees to choose among several benefits, such as life insurance, medical care, and vacation days, and among several levels of coverage within a given benefit.

Notes on the data

ADDITIONAL INFORMATION ON THE NCS benefit measures is available at **www.bls. gov/ncs/ebs/home.htm** or by telephone at (202) 691–6199.

Work stoppages

Description of the series

Data on work stoppages measure the number and duration of major strikes or lockouts (involving 1,000 workers or more) occurring during the month (or year), the number of workers involved, and the amount of work time lost because of stoppage. These data are presented in table 37.

Data are largely from a variety of published sources and cover only establishments directly involved in a stoppage. They do not measure the indirect or secondary effect of stoppages on other establishments whose employees are idle owing to material shortages or lack of service.

Definitions

Number of stoppages: The number of strikes and lockouts involving 1,000 workers or more and lasting a full shift or longer.

Workers involved: The number of workers directly involved in the stoppage.

Number of days idle: The aggregate number of workdays lost by workers involved

in the stoppages.

Days of idleness as a percent of estimated working time: Aggregate workdays lost as a percent of the aggregate number of standard workdays in the period multiplied by total employment in the period.

Notes on the data

This series is not comparable with the one terminated in 1981 that covered strikes involving six workers or more.

ADDITIONAL INFORMATION on work stop-pages data is available at **www. bls. gov/cba/home.htm** or by telephone at (202) 691–6199.

Price Data

(Tables 2; 38-46)

Price data are gathered by the Bureau of Labor Statistics from retail and primary markets in the United States. Price indexes are given in relation to a base period—December 2003 = 100 for many Producer Price Indexes (unless otherwise noted), 1982–84 = 100 for many Consumer Price Indexes (unless otherwise noted), and 1990 = 100 for International Price Indexes.

Consumer Price Indexes

Description of the series

The Consumer Price Index (CPI) is a measure of the average change in the prices paid by urban consumers for a fixed market basket of goods and services. The CPI is calculated monthly for two population groups, one consisting only of urban households whose primary source of income is derived from the employment of wage earners and clerical workers, and the other consisting of all urban households. The wage earner index (CPI-W) is a continuation of the historic index that was introduced well over a half-century ago for use in wage negotiations. As new uses were developed for the CPI in recent years, the need for a broader and more representative index became apparent. The all-urban consumer index (CPI-U), introduced in 1978, is representative of the 1993-95 buying habits of about 87 percent of the noninstitutional population of the United States at that time, compared with 32 percent represented in the CPI-W. In addition to wage earners and clerical workers, the CPI-U covers professional, managerial, and technical workers, the self-employed, shortterm workers, the unemployed, retirees, and others not in the labor force.

The CPI is based on prices of food, clothing, shelter, fuel, drugs, transportation fares, doctors' and dentists' fees, and other goods and services that people buy for day-to-day living. The quantity and quality of these items are kept essentially unchanged between major revisions so that only price changes will be measured. All taxes directly associated with the purchase and use of items are included in the index.

Data collected from more than 23,000 retail establishments and 5,800 housing units in 87 urban areas across the country are used to develop the "U.S. city average." Separate estimates for 14 major urban centers are presented in table 39. The areas listed are as indicated in footnote 1 to the table. The area indexes measure only the average change in prices for each area since the base period, and do not indicate differences in the level of prices among cities.

Notes on the data

In January 1983, the Bureau changed the way in which homeownership costs are meaured for the CPI-U. A rental equivalence method replaced the asset-price approach to homeownership costs for that series. In January 1985, the same change was made in the CPI-W. The central purpose of the change was to separate shelter costs from the investment component of homeownership so that the index would reflect only the cost of shelter services provided by owner-occupied homes. An updated CPI-U and CPI-W were introduced with release of the January 1987 and January 1998 data.

FOR ADDITIONAL INFORMATION, contact the Division of Prices and Price Indexes: (202) 691–7000.

Producer Price Indexes

Description of the series

Producer Price Indexes (PPI) measure average changes in prices received by domestic producers of commodities in all stages of processing. The sample used for calculating these indexes currently contains about 3,200 commodities and about 80,000 quotations per month, selected to represent the movement of prices of all commodities produced in the manufacturing; agriculture, forestry, and fishing; mining; and gas and electricity and public utilities sectors. The stage-of-processing structure of PPI organizes products by class of buyer and degree of fabrication (that is, finished goods, intermediate goods, and crude materials). The traditional commodity structure of PPI organizes products by similarity of end use or material composition. The industry and product structure of PPI organizes data in accordance with the North American Industry Classification System and product codes developed by the U.S. Census Bureau.

To the extent possible, prices used in calculating Producer Price Indexes apply to the first significant commercial transaction in the United States from the production or central marketing point. Price data are generally collected monthly, primarily by mail questionnaire. Most prices are obtained directly from producing companies on a voluntary and confidential basis. Prices generally are reported for the Tuesday of the week containing the 13th day of the month.

Since January 1992, price changes for the various commodities have been averaged together with implicit quantity weights representing their importance in the total net selling value of all commodities as of 1987. The detailed data are aggregated to obtain indexes for stage-of-processing groupings, commodity groupings, durability-of-product groupings, and a number of special composite groups. All Producer Price Index data are subject to revision 4 months after original publication.

FOR ADDITIONAL INFORMATION, contact the Division of Industrial Prices and Price Indexes: (202) 691–7705.

International Price Indexes

Description of the series

The **International Price Program** produces monthly and quarterly export and import price indexes for nonmilitary goods and services traded between the United States and the rest of the world. The export price index provides a measure of price change for all products sold by U.S. residents to foreign buyers. ("Residents" is defined as in the national income accounts; it includes corporations, businesses, and individuals, but does not require the organizations to be U.S. owned nor the individuals to have U.S. citizenship.) The import price index provides a measure of price change for goods purchased from other countries by U.S. residents.

The product universe for both the import and export indexes includes raw materials, agricultural products, semifinished manufactures, and finished manufactures, including both capital and consumer goods. Price data for these items are collected primarily by mail questionnaire. In nearly all cases, the data are collected directly from the exporter or importer, although in a few cases, prices are obtained from other sources.

To the extent possible, the data gathered refer to prices at the U.S. border for exports and at either the foreign border or the U.S. border for imports. For nearly all products, the prices refer to transactions completed during the first week of the month. Survey respondents are asked to indicate all discounts, allowances, and rebates applicable to the reported prices, so that the price used in the calculation of the indexes is the actual price for which the product was bought or sold.

In addition to general indexes of prices for U.S. exports and imports, indexes are also published for detailed product categories of exports and imports. These categories are defined according to the five-digit level of detail for the Bureau of Economic Analysis End-use Classification, the three-digit level for the Standard International Trade Classification (SITC), and the four-digit level of detail for the Harmonized System. Aggregate import indexes by country or region of origin are also available.

BLS publishes indexes for selected categories of internationally traded services, calculated on an international basis and on a balance-of-payments basis.

Notes on the data

The export and import price indexes are weighted indexes of the Laspeyres type. The trade weights currently used to compute both indexes relate to 2000.

Because a price index depends on the same items being priced from period to period, it is necessary to recognize when a product's specifications or terms of transaction have been modified. For this reason, the Bureau's questionnaire requests detailed descriptions of the physical and functional characteristics of the products being priced, as well as information on the number of units bought or sold, discounts, credit terms, packaging, class of buyer or seller, and so forth. When there are changes in either the specifications or terms of transaction of a product, the dollar value of each change is deleted from the total price change to obtain the "pure" change. Once this value is determined, a linking procedure is employed which allows for the continued repricing of the item.

FOR ADDITIONAL INFORMATION, contact the Division of International Prices: (202) 691–7155.

Productivity Data

(Tables 2; 47–50)

Business and major sectors

Description of the series

The productivity measures relate real output to real input. As such, they encompass a family of measures which include single-factor input measures, such as output per hour, output per unit of labor input, or output per unit of capital input, as well as measures of multifactor productivity (output per unit of combined labor and capital inputs). The Bureau indexes show the change in output relative to changes in the various inputs. The measures cover the business, nonfarm business, manufacturing, and nonfinancial corporate sectors.

Corresponding indexes of hourly compensation, unit labor costs, unit nonlabor payments, and prices are also provided.

Definitions

Output per hour of all persons (labor productivity) is the quantity of goods and services produced per hour of labor input. Output per unit of capital services (capital productivity) is the quantity of goods and services produced per unit of capital services input. Multifactor productivity is the quantity of goods and services produced per combined inputs. For private business and private nonfarm business, inputs include labor and capital units. For manufacturing, inputs include labor, capital, energy, nonenergy materials, and purchased business services.

Compensation per hour is total compensation divided by hours at work. Total compensation equals the wages and salaries of employees plus employers' contributions for social insurance and private benefit plans, plus an estimate of these payments for the self-employed (except for nonfinancial corporations in which there are no self-employed). **Real compensation per hour** is compensation per hour deflated by the change in the Consumer Price Index for All Urban Consumers.

Unit labor costs are the labor compensation costs expended in the production of a unit of output and are derived by dividing compensation by output. Unit nonlabor payments include profits, depreciation, interest, and indirect taxes per unit of output. They are computed by subtracting compensation of all persons from current-dollar value of output and dividing by output.

Unit nonlabor costs contain all the components of unit nonlabor payments except unit profits.

Unit profits include corporate profits with inventory valuation and capital consumption adjustments per unit of output.

Hours of all persons are the total hours at work of payroll workers, self-employed persons, and unpaid family workers.

Labor inputs are hours of all persons adjusted for the effects of changes in the education and experience of the labor force.

Capital services are the flow of services from the capital stock used in production. It

is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories—weighted by rental prices for each type of asset.

Combined units of labor and capital inputs are derived by combining changes in labor and capital input with weights which represent each component's share of total cost. Combined units of labor, capital, energy, materials, and purchased business services are similarly derived by combining changes in each input with weights that represent each input's share of total costs. The indexes for each input and for combined units are based on changing weights which are averages of the shares in the current and preceding year (the Tornquist index-number formula).

Notes on the data

Business sector output is an annuallyweighted index constructed by excluding from real gross domestic product (GDP) the following outputs: general government, nonprofit institutions, paid employees of private households, and the rental value of owner-occupied dwellings. Nonfarm business also excludes farming. Private business and private nonfarm business further exclude government enterprises. The measures are supplied by the U.S. Department of Commerce's Bureau of Economic Analysis. Annual estimates of manufacturing sectoral output are produced by the Bureau of Labor Statistics. Quarterly manufacturing output indexes from the Federal Reserve Board are adjusted to these annual output measures by the BLS. Compensation data are developed from data of the Bureau of Economic Analysis and the Bureau of Labor Statistics. Hours data are developed from data of the Bureau of Labor Statistics.

The productivity and associated cost measures in tables 47–50 describe the relationship between output in real terms and the labor and capital inputs involved in its production. They show the changes from period to period in the amount of goods and services produced per unit of input.

Although these measures relate output to hours and capital services, they do not measure the contributions of labor, capital, or any other specific factor of production. Rather, they reflect the joint effect of many influences, including changes in technology; shifts in the composition of the labor force; capital investment; level of output; changes in the utilization of capacity, energy, material, and research and development; the organization of production; managerial skill; and characteristics and efforts of the work force. FOR ADDITIONAL INFORMATION on this productivity series, contact the Division of Productivity Research: (202) 691–5606.

Industry productivity measures

Description of the series

The BLS industry productivity indexes measure the relationship between output and inputs for selected industries and industry groups, and thus reflect trends in industry efficiency over time. Industry measures include labor productivity, multifactor productivity, compensation, and unit labor costs.

The industry measures differ in methodology and data sources from the productivity measures for the major sectors because the industry measures are developed independently of the National Income and Product Accounts framework used for the major sector measures.

Definitions

Output per hour is derived by dividing an index of industry output by an index of labor input. For most industries, **output** indexes are derived from data on the value of industry output adjusted for price change. For the remaining industries, output indexes are derived from data on the physical quantity of production.

The **labor input** series is based on the hours of all workers or, in the case of some transportation industries, on the number of employees. For most industries, the series consists of the hours of all employees. For some trade and services industries, the series also includes the hours of partners, proprietors, and unpaid family workers.

Unit labor costs represent the labor compensation costs per unit of output produced, and are derived by dividing an index of labor compensation by an index of output. Labor compensation includes payroll as well as supplemental payments, including both legally required expenditures and payments for voluntary programs.

Multifactor productivity is derived by dividing an index of industry output by an index of combined inputs consumed in producing that output. Combined inputs include capital, labor, and intermediate purchases. The measure of capital input represents the flow of services from the capital stock used in production. It is developed from measures of the net stock of physical assets—equipment, structures, land, and inventories. The measure of intermediate purchases is a combination of purchased materials, services, fuels, and electricity.

Notes on the data

The industry measures are compiled from data produced by the Bureau of Labor Statistics and the Census Bureau, with additional data supplied by other government agencies, trade associations, and other sources.

International Comparisons

(Tables 51-53)

Labor force and unemployment

Description of the series

Tables 51 and 52 present comparative measures of the labor force, employment, and unemployment adjusted to U.S. concepts for the United States, Canada, Australia, Japan, and six European countries. The Bureau adjusts the figures for these selected countries, for all known major definitional differences, to the extent that data to prepare adjustments are available. Although precise comparability may not be achieved, these adjusted figures provide a better basis for international comparisons than the figures regularly published by each country. For further information on adjustments and comparability issues, see Constance Sorrentino, "International unemployment rates: how comparable are they?" Monthly Labor Review, June 2000, pp. 3-20, available on the Internet at www.bls.gov/opub/ mlr/2000/06/art1full.pdf.

Definitions

For the principal U.S. definitions of the labor force, employment, and unemployment, see the Notes section on Employment and Unemployment Data: Household survey data.

Notes on the data

Foreign-country data are adjusted as closely as possible to the U.S. definitions. Primary areas of adjustment address conceptual differences in upper age limits and definitions of employment and unemployment, provided that reliable data are available to make these adjustments. Adjustments are made where applicable to include employed and unemployed persons above upper age limits and to exclude active duty military from employment figures, although a small number of career military may be included in some European countries. Adjustments are made to exclude unpaid family workers who worked fewer than 15 hours per week from employment figures; U.S. concepts do not include them in employment, whereas most foreign countries include all unpaid family workers regardless of the number of hours worked. Adjustments are made to include full-time students seeking work and available for work as unemployed when they are classified as not in the labor force.

Where possible, lower age limits are based on the age at which compulsory schooling ends in each country, rather than based on the U.S. standard of 16. Lower age limits have ranged between 13 and 16 over the years covered; currently, the lower age limits are either 15 or 16 in all 10 countries.

Some adjustments for comparability are not made because data are unavailable for adjustment purposes. For example, no adjustments to unemployment are usually made for deviations from U.S. concepts in the treatment of persons waiting to start a new job or passive job seekers. These conceptual differences have little impact on the measures. Furthermore, BLS studies have concluded that no adjustments should be made for persons on layoff who are counted as employed in some countries because of their strong job attachment as evidenced by, for example, payment of salary or the existence of a recall date. In the United States, persons on layoff have weaker job attachment and are classified as unemployed.

The annual labor force measures are obtained from monthly, quarterly, or continuous household surveys and may be calculated as averages of monthly or quarterly data. Quarterly and monthly unemployment rates are based on household surveys. For some countries, they are calculated by applying annual adjustment factors to current published data and, therefore, are less precise indicators of unemployment under U.S. concepts than the annual figures.

The labor force measures may have breaks in series over time due to changes in surveys, sources, or estimation methods. Breaks are noted in data tables.

For up-to-date information on adjustments and breaks in series, see the Introduction and Appendix B. Country Notes in International Comparisons of Annual Labor Force Statistics, Adjusted to U.S. Concepts, 10 Countries, 1997–2009, on the Internet at www.bls.gov/ilc/flscomparelf.htm, and the Notes for Table 1 in the monthly report International Unemployment Rates and Employment Indexes, Seasonally Adjusted, 2008–2010, on the Internet at www.bls.gov/ilc/intl_unemployment_rates_monthly.htm.

Manufacturing productivity and labor costs

Description of the series

Table 53 presents comparative indexes of manufacturing output per hour (labor productivity), output, total hours, compensation per hour, and unit labor costs for 19 countries. These measures are trend comparisons—that is, series that measure changes over time—rather than level comparisons. BLS does not recommend using these series for level comparisons because of technical problems.

BLS constructs the comparative indexes from three basic aggregate measures—output, total labor hours, and total compensation. The hours and compensation measures refer to employees (wage and salary earners) in Belgium and Taiwan. For all other economies, the measures refer to all employed persons, including employees, self-employed persons, and unpaid family workers.

The data for recent years are based on the United Nations System of National Accounts 1993 (SNA 93). Manufacturing is generally defined according to the International Standard Industrial Classification (ISIC). However, the measures for France include parts of mining as well. For the United States and Canada, manufacturing is defined according to the North American Industry Classification System (NAICS 97).

Definitions

Output. For most economies, the output measures are real value added in manufacturing from national accounts. However, output for Japan prior to 1970 and for the Netherlands prior to 1960 are indexes of industrial production. The manufacturing value added measures for the United Kingdom are essentially identical to their indexes of industrial production.

For the United States, the output measure is a chain-weighted index of real value added produced by the Bureau of Economic Analysis. BLS uses this series here to preserve international comparability. However, for its domestic industry measures, shown in tables 47–50 in this section, BLS uses a different output measures called "sectoral output," which is gross output less intrasector transactions.

Total hours refer to hours worked in all economies. The measures are developed from

statistics of manufacturing employment and average hours. For most other economies, recent years' aggregate hours series are obtained from national statistical offices, usually from national accounts. However, for some economies and for earlier years, BLS calculates the aggregate hours series using employment figures published with the national accounts, or other comprehensive employment series, and data on average hours worked.

Hourly compensation is total compensation divided by total hours. Total compensation includes all payments in cash or in-kind made directly to employees plus employer expenditures for legally required insurance programs and contractual and private benefit plans. For Australia, Canada, France, Singapore, and Sweden, compensation is increased to account for important taxes on payroll or employment. For the Czech Republic, Finland, and the United Kingdom, compensation is reduced in certain years to account for subsidies.

Labor productivity is defined as real output per hour worked. Although the labor productivity measure presented in this release relates output to the hours worked of persons employed in manufacturing, it does not measure the specific contributions of labor as a single factor of production. Rather, it reflects the joint effects of many influences, including new technology, capital investment, capacity utilization, energy use, and managerial skills, as well as the skills and efforts of the workforce.

Unit labor costs are defined as the cost of labor input required to produce one unit of output. They are computed as compensation in nominal terms divided by real output.

Notes on the data

The measures for recent years may be based on current indicators of manufacturing output (such as industrial production indexes), employment, average hours, and hourly compensation until national accounts and other statistics used for the long-term measures become available. For more in-depth information on sources and methods, see http:// www.bls.gov/news.release/prod4.toc.htm.

Occupational Injury and Illness Data

(Tables 54-55)

Survey of Occupational Injuries and Illnesses

Description of the series

The Survey of Occupational Injuries and Illnesses collects data from employers about their workers' job-related nonfatal injuries and illnesses. The information that employers provide is based on records that they maintain under the Occupational Safety and Health Act of 1970. Self-employed individuals, farms with fewer than 11 employees, employers regulated by other Federal safety and health laws, and Federal, State, and local government agencies are excluded from the survey.

The survey is a Federal-State cooperative program with an independent sample selected for each participating State. A stratified random sample with a Neyman allocation is selected to represent all private industries in the State. The survey is stratified by Standard Industrial Classification and size of employment.

Definitions

Under the Occupational Safety and Health Act, employers maintain records of nonfatal work-related injuries and illnesses that involve one or more of the following: loss of consciousness, restriction of work or motion, transfer to another job, or medical treatment other than first aid.

Occupational injury is any injury such as a cut, fracture, sprain, or amputation that results from a work-related event or a single, instantaneous exposure in the work environment.

Occupational illness is an abnormal condition or disorder, other than one resulting from an occupational injury, caused by exposure to factors associated with employment. It includes acute and chronic illnesses or disease which may be caused by inhalation, absorption, ingestion, or direct contact.

Lost workday injuries and illnesses are cases that involve days away from work, or days of restricted work activity, or both.

Lost workdays include the number of workdays (consecutive or not) on which the employee was either away from work or at work in some restricted capacity, or both, because of an occupational injury or illness. BLS measures of the number and incidence rate of lost workdays were discontinued beginning with the 1993 survey. The number of days away from work or days of restricted work activity does not include the day of injury or onset of illness or any days on which the employee would not have worked, such as a Federal holiday, even though able to work. **Incidence rates** are computed as the number of injuries and/or illnesses or lost work days per 100 full-time workers.

Notes on the data

The definitions of occupational injuries and illnesses are from *Recordkeeping Guidelines for Occupational Injuries and Illnesses* (U.S. Department of Labor, Bureau of Labor Statistics, September 1986).

Estimates are made for industries and employment size classes for total recordable cases, lost workday cases, days away from work cases, and nonfatal cases without lost workdays. These data also are shown separately for injuries. Illness data are available for seven categories: occupational skin diseases or disorders, dust diseases of the lungs, respiratory conditions due to toxic agents, poisoning (systemic effects of toxic agents), disorders due to physical agents (other than toxic materials), disorders associated with repeated trauma, and all other occupational illnesses.

The survey continues to measure the number of new work-related illness cases which are recognized, diagnosed, and reported during the year. Some conditions, for example, long-term latent illnesses caused by exposure to carcinogens, often are difficult to relate to the workplace and are not adequately recognized and reported. These long-term latent illnesses are believed to be understated in the survey's illness measure. In contrast, the overwhelming majority of the reported new illnesses are those which are easier to directly relate to workplace activity (for example, contact dermatitis and carpal tunnel syndrome).

Most of the estimates are in the form of incidence rates, defined as the number of injuries and illnesses per 100 equivalent fulltime workers. For this purpose, 200,000 employee hours represent 100 employee years (2,000 hours per employee). Full detail on the available measures is presented in the annual bulletin, *Occupational Injuries and* Illnesses: Counts, Rates, and Characteristics.

Comparable data for more than 40 States and territories are available from the BLS Office of Safety, Health and Working Conditions. Many of these States publish data on State and local government employees in addition to private industry data.

Mining and railroad data are furnished to BLS by the Mine Safety and Health Administration and the Federal Railroad Administration. Data from these organizations are included in both the national and State data published annually.

With the 1992 survey, BLS began publishing details on serious, nonfatal incidents resulting in days away from work. Included are some major characteristics of the injured and ill workers, such as occupation, age, gender, race, and length of service, as well as the circumstances of their injuries and illnesses (nature of the disabling condition, part of body affected, event and exposure, and the source directly producing the condition). In general, these data are available nationwide for detailed industries and for individual States at more aggregated industry levels.

FOR ADDITIONAL INFORMATION on occupational injuries and illnesses, contact the Office of Occupational Safety, Health and Working Conditions at (202) 691–6180, or access the Internet at: www.bls. gov/iif/.

Census of Fatal Occupational Injuries

The Census of Fatal Occupational Injuries compiles a complete roster of fatal job-related injuries, including detailed data about the fatally injured workers and the fatal events. The program collects and cross checks fatality information from multiple sources, including death certificates, State and Federal workers' compensation reports, Occupational Safety and Health Administration and Mine Safety and Health Administration records, medical examiner and autopsy reports, media accounts, State motor vehicle fatality records, and follow-up questionnaires to employers.

In addition to private wage and salary workers, the self-employed, family members, and Federal, State, and local government workers are covered by the program. To be included in the fatality census, the decedent must have been employed (that is working for pay, compensation, or profit) at the time of the event, engaged in a legal work activity, or present at the site of the incident as a requirement of his or her job.

Definition

A fatal work injury is any intentional or unintentional wound or damage to the body resulting in death from acute exposure to energy, such as heat or electricity, or kinetic energy from a crash, or from the absence of such essentials as heat or oxygen caused by a specific event or incident or series of events within a single workday or shift. Fatalities that occur during a person's commute to or from work are excluded from the census, as well as work-related illnesses,which can be difficult to identify due to long latency periods.

Notes on the data

Twenty-eight data elements are collected, coded, and tabulated in the fatality program, including information about the fatally injured worker, the fatal incident, and the machinery or equipment involved. Summary worker demographic data and event characteristics are included in a national news release that is available about 8 months after the end of the reference year. The Census of Fatal Occupational Injuries was initiated in 1992 as a joint Federal-State effort. Most States issue summary information at the time of the national news release.

FOR ADDITIONAL INFORMATION on the Census of Fatal Occupational Injuries contact the BLS Office of Safety, Health, and Working Conditions at (202) 691–6175, or the Internet at: www.bls.gov/iif/

Quarterly data seasonally adjusted.
 Annual changes are December-to-December changes. Quarterly changes are calculated using the last month of each quarter.
 The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

 ⁴ Excludes Federal and private household workers.
 ⁵ Goods-producing industries include mining, construction, and manufacturing. Serviceproviding industries include all other private sector industries.

NOTE: Beginning in January 2003, household survey data reflect revised population controls. Nonfarm data reflect the conversion to the 2002 version of the North American Industry Classification System (NAICS), replacing the Standard Industrial Classification (SIC) system. NAICS-based data by industry are not comparable with SIC-based data.

¹ Seasonally adjusted. "Quarterly average" is percent change from a quarter ago, at an annual rate. ² The Employment Cost Index data reflect the conversion to the 2002

North American Classification System (NAICS) and the 2000 Standard

Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

³ Excludes Federal and private household workers.

4. Employment status of the population, by sex, age, race, and Hispanic origin, monthly data seasonally adjusted

¹ The population figures are not seasonally adjusted.

 ² Civilian employment as a percent of the civilian noninstitutional population.
 ³ Beginning in 2003, persons who selected this race group only; persons who selected more than one race group are not included. Prior to 2003, persons who reported more than one race were included in the group they identified as the main race.

NOTE: Estimates for the above race groups (white and black or African American) do not sum to totals because data are not presented for all races. In addition, persons whose ethnicity is identified as Hispanic or Latino may be of any race and, therefore, are classified by ethnicity as well as by race. Beginning in January 2003, data reflect revised population controls used in the household survey.

NOTE: Figures are the percent of industries with employment increasing plus one-half of the industries with unchanged employment, where 50 percent indicates an equal balance between industries with increasing and decreasing employment.

See the "Definitions" in this section. See "Notes on the data" for a description of the most recent benchmark revision.

Data for the two most recent months are preliminary.

26. Continued — Average annual wages for 2008 and 2009 for all covered workers' by metropolitan area

¹ Includes workers covered by Unemployment Insurance (UI) and Unemployment Compensation for Federal Employees (UCFE) programs.

² Includes data for Metropolitan Statistical Areas (MSA) as defined by OMB Bulletin No. 04-03 as of February 18, 2004. ³ Each year's total is based on the MSA definition for the specific year. Annual changes include differences resulting from changes in MSA definitions.

⁴ Totals do not include the six MSAs within Puerto Rico.

27. Annual data: Employment status of the population

¹ Cost (cents per hour worked) measured in the Employment Cost Index consists of wages, salaries, and employer cost of employee benefits.
 ² Consists of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.
 ³ Consists of legislative, judicial, administrative, and regulatory activities.

NOTE: The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

¹ Consists of private industry workers (excluding farm and household workers) and State and local government (excluding Federal Government) workers.
 ² Consists of legislative, judicial, administrative, and regulatory activities. NOTE: The Employment Cost Index data reflect the conversion to the 2002 North

American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

¹ The indexes are calculated differently from those for the occupation and industry groups. For a detailed description of the index calculation, see the Monthly Labor Review Technical Note, "Estimation procedures for the Employment Cost Index," May 1982. NOTE: The Employment Cost Index data reflect the conversion to the 2002 North American Classification System (NAICS) and the 2000 Standard Occupational Classification (SOC) system. The NAICS and SOC data shown prior to 2006 are for informational purposes only. Series based on NAICS and SOC became the official BLS estimates starting in March 2006.

¹ The 2002 North American Industry Classification System (NAICS) replaced the 1987 Standard Industrial Classification (SIC) System. Estimates for goods-producing and service-providing (formerly service-producing) industries are considered comparable. Also introduced was the 2000 Standard Occupational Classification (SOC) to replace the 1990 Census of Population system. Only service occupations are considered comparable.

 $^{2}\,$ The white-collar and blue-collar occupation series were discontinued effective 2007.

³ The take-up rate is an estimate of the percentage of workers with access to a plan who participate in the plan.

Note: Where applicable, dashes indicate no employees in this category or data do not meet publication criteria.

| Percent of estimated working time 1 | 0 | 0 | 0 | 0.01 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

¹ Agricultural and government employees are included in the total employed and total working time; private household, forestry, and fishery employees are excluded. An explanation of the measurement of idleness as a percentage of the total time worked is found in "Total economy measures of strike idleness," *Monthly Labor Review*, October 1968, pp. 54–56.

NOTE: p = preliminary.

38. Consumer Price Indexes for All Urban Consumers and for Urban Wage Earners and Clerical Workers: U.S. city average, by expenditure category and commodity or service group

¹ Foods, fuels, and several other items priced every month in all areas; most other goods and services priced as indicated:

M—Every month. 1—January, March, May, July, September, and November.

2-February, April, June, August, October, and December.

² Regions defined as the four Census regions.
 ³ Indexes on a December 1996 = 100 base.
 ⁴ The "North Central" region has been renamed the "Midwest" region by the Census

⁵ Indexes on a December 1986 = 100 base.
 ⁶ In addition, the following metropolitan areas are published semiannually and appear in tables 34 and 39 of the January and July issues of the *CPI Detailed*

Report: Anchorage, AK; Cincinnatti, OH–KY–IN; Kansas City, MO–KS; Milwaukee–Racine, WI; Minneapolis–St. Paul, MN–WI; Pittsburgh, PA; Port-land–Salem, OR–WA; St Louis, MO–IL; San Diego, CA; Tampa–St. Petersburg–Clearwater, FL. ⁷ Indexes on a November 1996 = 100 base.

NOTE: Local area CPI indexes are byproducts of the national CPI program. Each local index has a smaller sample size and is, therefore, subject to substantially more sampling and other measurement error. As a result, local area indexes show greater volatility than the national index, although their long-term trends are similar. Therefore, the Bureau of Labor Statistics strongly urges users to consider adopting the national average CPI for use in their escalator clauses. Index applies to a month as a whole, not to any specific date. Dash indicates data not available.

Dash indicates data are not available. Quarterly figures for Germany are calculated by applying an annual adjustment factor to current published data and therefore should be viewed as a less precise indicator of unemployment under U.S. concepts than the annual figures. For further qualifications and historical annual data, see the BLS report International Comparisons of Annual Labor Force Statistics, Adjusted to U.S. Concepts, 10 Countries (on the Internet at http://www.bls.gov/ilc/flscomparelf.htm).

For monthly unemployment rates, as well as the quarterly and annual rates published in this table, see the BLS report International Unemployment Rates and Employment Indexes, Seasonally Adjusted (on the Internet at

(on the Internet at http://www.bls.gov/ilc/intl_unemployment_rates_monthly.htm). Unemployment rates may differ between the two reports mentioned, because the former is updated annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.

52. Annual data: employment status of the working-age population, adjusted to U.S. concepts, 10 countries

¹ Labor force as a percent of the working-age population.
 ² Employment as a percent of the working-age population.
 ³ Unemployment as a percent of the labor force.

NOTE: There are breaks in series for the United States (2003, 2004), Australia (2001), Germany (2005), the Netherlands (2003), and Sweden (2005). For further qualifications and historical annual data, see the BLS report *International*

Comparisons of Annual Labor Force Statistics, Adjusted to U.S. Concepts, 10 Countries (on the Internet at http://www.bls.gov/ilc/flscomparelf.htm). Unemployment rates may differ from those in the BLS report International Unemployment Rates and Employment Indexes, Seasonally Adjusted (on the Internet at http://www.bls.gov/ilc/flscomparelf.attes_monthly.htm), because the former is updated annually, whereas the latter is updated monthly and reflects the most recent revisions in source data.

55. Fatal occupational injuries by event or exposure, 1996-2005

 Based on the 1992 BLS Occupational Injury and Illness Classification Manual.
 Excludes fatalities from the Sept. 11, 2001, terrorist attacks.
 The BLS news release of August 10, 2006, reported a total of 5,702 fatal work injuries for calendar year 2005. Since then, an additional 32 job-related fatalities were identified, bringing the total job-related fatality count for 2005 to 5,734.

NOTE: Totals for all years are revised and final. Totals for major categories may include subcategories not shown separately. Dashes indicate no data reported or data that do not meet publication criteria. N.e.c. means "not elsewhere classified."
